EXTRACT

*From an Act prescribing Rules for the Government of the State Library,
passed March 8th, 1861.*

SECTION 11. The Librarian shall cause to be kept a register of all books issued and returned; and all books taken by the members of the Legislature, or its officers, shall be returned at the close of the session. If any person injure or fail to return any book taken from the Library, he shall forfeit and pay to the Librarian, for the benefit of the Library, three times the value thereof; and before the Controller shall issue his warrant in favor of any member or officer of the Legislature, or of this State, for his per diem, allowance, or salary, he shall be satisfied that such member or officer has returned all books taken out of the Library by him, and has settled all accounts for injuring such books or otherwise.

SEC. 15. Books may be taken from the Library by the members of the Legislature and its officers during the session of the same, and at any time by the Governor and the officers of the Executive Department of this State who are required to keep their offices at the seat of government, the Justices of the Supreme Court, the Attorney-General, and the Trustees of the Library.

Mining and Scientific Press.

Terms: One Year, \$5; Six Months, \$3.

Single Copies, Fifteen Cents.

A Journal of Useful Arts, Science, and Mining and Mechanical Progress.

Contributions to our Cabinet.	16

LONGLEY'S PATENT HOISTING APPARATUS.

This hoisting apparatus is coming largely into use, and is much commended for its extreme simplicity, and the great facility with which it can be applied to a variety of purposes, as well as for the great weight which it can be made to lift, with a small application of power. Our engraving represents one man in the act of lifting a locomotive from the track, which, we suppose, cannot be one of the largest size, as the inventor claims no more than that by its aid one man can lift twelve tons; which, of itself, however, is quite sufficient to render the apparatus a most valuable and efficient aid in raising heavy bodies.

Mr. Longley obtained his first patent, March 1st, 1864. The engraving we give to-day represents an improvement in the original invention, which consists in the use of a worm-wheel instead of a pinion and spur-wheel, to increase the force applied in lifting. The apparatus, as now constructed, was first described in the *New York Artisan* of March 28, 1866, as follows:

The lifting-chain passes over differential pulleys or chain-wheels, F and E, so that, in lifting, the smaller unwinds as the larger winds up, and the effective lift at each turn is equal to half the difference between the circumferences of the two pulleys. Motion is given to the chain-wheels by the screw, C, acting on the worm-wheel, D, which is fixed on the same shaft as the chain-wheels. The screw is turned by the chain-pulley, B, which is fixed upon the screw-shaft. The hand-chain or rope is endless. As one turn of the hand-chain pulley, B, turns the worm-wheel, D, one tooth; and one turn of the worm-wheel lifts the load through a space equal to half the difference of the circumferences of the chain-wheels, and as this difference may be as small as required, and the pitch of the screw and worm-wheel may be fine, and the pulley of the hand-chain wheel may be large, it is evident that a great lifting power can be attained with these few simple parts, and that very heavy loads may be lifted by the apparatus. When lowering the sheave-block, G, the worm-screw is disengaged from the worm-wheel, so that it may be run down fast. And when lifting weights less than a ton it may be left disengaged; and the lifting may be done by hauling upon the loop of

the main lifting chain; and thus a quick movement may be given for light work, or a slow movement for heavy work, merely by pulling a cord, which, by means of an eccentric, A, gears and ungears the screw and worm-wheel.

For ordinary work, the apparatus is so proportioned that a pull of 25 lbs. on the hand-chain, or rope, will lift a ton. For heavy work, it may be proportioned so that one ton can be

be worked with advantage by steam or horse power, especially for heavy lifting. When there is not constant work to warrant the expense of such machinery, it may be desirable for heavy jobs, a cheap portable apparatus is the most convenient and economical; and this is offered us the best machine for such cases.

Patented in the United States on Oct. 24, 1865, through the "American Artisan Patent Agency," by S. M. Longley, of Hudson, Columbia county, N. Y. Patents are also in progress in European countries.

PATENT HOISTING APPARATUS.

lifted for every pound weight applied to the hand-chain. Mechanics who have used this apparatus agree that it is more efficient, and more easily adaptable to either heavy or light work than any other apparatus of equal weight and portability. The weight of a 1-ton apparatus, to lift 15 feet high, is but 63 lbs. It can

be defined by almost perpendicular walls, being at least seven feet in width at one point where it had been opened by a shaft of thirty feet in depth. It is known to contain fine gold in quantities varying from \$5 to \$35 per ton, having worked up to the higher figures here given, the metal being found well diffused

through the rock, of which there appear to be thousands of tons thrown up here above the surface. It possesses advantages in point of accessibility and facilities for working rarely found, the lode being crossed near the largest chimney by Dry Creek, which has a fall of upwards of fifty feet, and a ditch already constructed which conveys an abundant supply of free water from this, and also from Indian Creek, but a short distance above. The parties interested in the mine expect soon to avail themselves of the advantages here claimed, and will be able, I trust, in a short time to open up one of the most valuable, as it now is one of the largest, claims in the county."

[Reported for the Mining and Scientific Press.]

California Academy of Natural Sciences.

REGULAR MEETING, July 2, 1866.

President Ransom in the Chair.

Twelve members present.

Minutes of previous meeting read and approved.

Messrs. Vitus Wackenreder, Sherman Day, Thos. Price, and E. Wertheman, were elected resident members.

Dr. Pawlicki was proposed for resident membership by Dr. Behr.

Dr. P. Condie, of H. M. S. Sparrowhawk, now at Victoria, V. I., was proposed as corresponding member by the President.

Specimens of ores from Grasa Valley, (Eureka mine), and from the Pahrangat district, (Othello mine), were presented by Mr. Hanks. Steatite, from Capt. Morgan's ranch, Ballenaa Bay, by Capt. Morgan, and curious fungi from the timbers of Nevada mines, by Mr. Ewer.

A large number of valuable books were received from Doctor F. Mueller, of Australia. Various pamphlets by mail from individuals and societies in the East, and a number of Congressional documents from Hon. John Conness, were laid on the table.

Mr. Dall announced on the authority of the newspapers, that the collections, etc., of the New York Lyceum of Natural History, were destroyed in the late fire which burned the Academy of Music.

Dr. James Blake offered the following resolutions, which were adopted:

Resolved, That on learning of the recent loss experienced by the N. Y. Lyceum of Natural History, the California Academy of Natural Sciences, desire to express their sympathy with that Society, and trust that the calamity which has befallen them, will offer but a temporary check to their career of usefulness, and

Resolved, That the Secretary be instructed to forward to the said Society (if desired), a copy of our Proceedings, as far as the disposable copies will admit.

Dr. Gibbons called attention to the researches of Dr. Salisbury, of Ohio, in regard to malarial diseases, and their supposed animal or vegetable origin.

Dr. Hillebrand gave an interesting account of the botanical garden, of Batavia, which contains, among other plants, 262 species of palms. He also described the introduction of the various species of Cinchona trees into India and Java; the difficulties attending it, and its final and great success. Adjourned.

WM. H. DALL, Secretary pro tem.

LAWRENCE CONCANNON, an experienced core maker employed in this foundry department of the Golden State Iron Works, recently fell from the window of his boarding-house, receiving injuries from which he died. He was a steady worker, and much respected by his shopmates, who turned out to his funeral.

Two of Hungerford's new concentrators were sold at the Miners' Foundry, this week, to Mr. Morgan, for his mill near Jackson, Amador county.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Source of the Electric Current in the Voltaic Battery.

BY EDWARD PIQUE.

[Continued from Page 402.]

First Supposition.—Let us assume the action to commence on the copper plate. I say, therefore, the free negative electricity of the copper attracts and reduces the copper contained in the surrounding solution, the sulphuric acid and the oxygen are set free and attracted by the positive zinc, which, being oxydized and dissolved, accounts for the saturated solution of sulphate of zinc. This seems to me a very natural explanation.

Second Supposition.—Let us assume the action to commence on the zinc plate. The zinc would attract the oxygen and the acid of the surrounding solution, but just as fast as the sulphate of zinc would be formed and dissolved, the zinc contained in the solution would be attracted by the negative copper plate, and as first copper, then zinc would there be deposited. The consequence of this would be that the solution on the side of the zinc never would become concentrated, and that most likely the acid of the sulphate of copper never would travel over to the other side.

This second supposition is by no means supported by the results; the first one is completely so, showing that the action commences from the *copper plate*, and not from the zinc, that consequently in the galvanic battery electricity produces chemical changes, and not the contrary. In the above mentioned apparatus there are two fluids, separated by a porous diaphragm, which prevents the fluids from intermixing, but which allows the two solutions to touch each other inside the interposed porous body, so that the electricity can have a passage through the whole arrangement. On the copper side, the neutral solution of sulphate of copper has no chemical influence on the copper, and on the other side the neutral solution of sulphate of zinc has no chemical action on the zinc plate; and if such an action could take place, any chemist must allow that it would require a considerable length of time; but the action of the apparatus is *instantaneous* from the very moment the connexions are completed, and bears all the character of an electric action. Everything that succeeds must be considered a consequence of the same.

Having just before me Smee's *Electro-Metallurgy*, which is one of the most valuable books in this branch, I intend to copy a few paragraphs of it, to examine his views about the source of the power in galvanic batteries. Mr. Smee is no doubt one of the most learned electricians, and at the same time a strong defender of the chemical theory of the pile.

Smee's *Electro-Metallurgy*, § 16, page 7, says: "Whichever theory be adopted, the use of the negative plate is by no means apparent, for the quantity of electricity developed is exactly as the surface of negative metal exposed; thus, provided there be no obstacle to overcome, if the surface of this be doubled, the quantity of electricity will be likewise doubled. The extent of surface of the positive metal, within certain limits, is not of so much consequence."

This explanation, given by Mr. Smee, has been acknowledged by the oldest electricians, and to this day it is believed by all natural philosophers, that the most correct way of constructing a battery is to place the zinc inside of the copper, so as to give the copper a great deal more radiating surface than to the zinc. It is stated that the maximum evolution of electricity occurs when the copper is sixteen times larger than the zinc, and that in this case the quantity of electricity is four and a half times greater than when both plates are of equal size. I should consider this to be another proof, that the action emanates from the copper plate, and therefore originates from electricity.

Mr. Smee mentions likewise that Dr. Faraday had a galvanic battery constructed, consisting only of different solutions without any metal whatever.

My opinion about this matter is, that, since the contact of two different metals produces electricity, as has been proved before, the same must also be the case by the contact of two different fluids, as all the aqueous solutions are conductors of electricity, although in an inferior degree to the metals.

On page 59, Mr. Smee asserts, that the quantity of voltaic force is not dependent on the nature of the negative element. I should think that this is in contradiction to all the laws of nature, as the metals are known to be one more negative or positive than the other, having been placed in a series from the most negative to the most positive, and that the farther distant two metals in this series are, the more powerful must be the electric force arising between them.

Mr. Smee says further: "In a solution of sulphate of zinc, very slightly acidulated, the hydrogen could not be evolved from smooth copper, but would rather reduce the sulphate of zinc, when connected with a small battery. The substitution of smooth platinum in no way added to the power, but the employment of platinized platinum caused an abundant evolution of gas. Even iron caused gas to be evolved and increased the force passing, when smooth platinum would not have the effect."

Mr. Smee proves by the above nothing else but that a metal with a rough surface acts more powerfully than a metal with a smooth surface, as it is known that a gentle action will reduce metal, and a more violent action will cause hydrogen to be evolved. The reason is, that the induction of electricity takes place to a far greater distance from pointed bodies than from a smooth surface; therefore, acting more powerful on a rough surface, causes hydrogen to be evolved. To prove his assertion, that the quantity of voltaic force is not dependent on the nature of the negative element, he ought to have compared different metals with a rough surface, or all of them with a smooth surface, and then he would have found the greater energy of the negative metals. To compare rough iron with smooth platinum proves nothing.

Mr. Smee says further: "I observed that nitric acid allowed far more electricity to pass than sulphate of copper, and that, again, than dilute sulphuric acid, simply from the facility with which hydrogen reduces these substances being greater than the facility of its evolution."

It is certain that *nitric acid* absorbs the hydrogen, as this immediately connects with a part of the oxygen of the nitric acid, and this is one reason for the great power of nitric acid in galvanic batteries, because the hydrogen, like all the other gases, being an insulator of electricity, on being evolved at the negative plate, prevents, for the moment being, the passage of electricity between the two plates. Another reason is, that the nitric acid itself, being an excellent conductor, facilitates greatly the passage of electricity. For the same reason it requires much less power to decompose water, when slightly acidulated with sulphuric acid, because then the fluid conducts the electricity much better, although the sulphuric acid itself is not decomposed. The third reason is, to my opinion, that nitric acid, as a highly oxydized body, shows itself electro-negative, when, by means of a porous diaphragm, it comes in contact with another fluid, producing in this way an electric tension by the contact of the two fluids. *Sulphate of copper* possesses only one of the three advantages above given, namely, the absorption of hydrogen. It is neither such an excellent conductor, nor possesses the quality of being so much electro-negative as nitric acid.

Dilute *sulphuric acid* does not absorb hydrogen; neither is it so much negative as nitric acid. Its only advantage consists in making the water a better conductor, although in a much inferior degree than the nitric acid.

Mr. Smee further says: "In some cases the hydrogen would rather be evolved than to reduce a metallic salt—as sulphate of zinc—and in every case that the facility of its removal affected the amount of power passing, quite independently of the nature of the negative plate."

I have already expressed my opinion about this latter point. In regard to the sulphate of zinc, it is quite natural that, in an acid solution zinc cannot be deposited as a metal, since, as soon as the electricity passing would reduce the zinc as a metal, just so fast the metallic zinc, by the local chemical action of the dilute acid will be again oxydized and dissolved. Here are two powers, one acting in opposition to the other, and the one which is the strongest will influence the final effect.

Smee's *Metallurgy*: "These facts appeared to me a positive proof of there being no such

thing as a negative plate contributing to the production of power, and that this latter is of no value, further than as a means for the removal of the second element of the intervening compound fluid."

I think Mr. Smee contradicts himself here, because he did say (§ 16 p. 7), that the quantity of electricity developed is exactly as the surface of negative metal exposed; thus, if the surface of this be doubled, the quantity of electricity will be likewise doubled.

What he says, that the negative plate has no other business but to remove the second element of the compound fluid, as, for instance, the hydrogen, I do not see the least occasion for it, because nitric acid or blue vitriol will accomplish the same without any further ceremony.

Smee gives now his explanation of the nature of the voltaic force, saying: "If the force, from the experiments of Faraday, is proved to depend on chemical action, and the negative pole from my own experiments is proved to be useless, except as affording the means for the removal of the second element of the compound fluid, then it follows as a natural consequence, that if the chemical affinity of any substance for one element of a compound fluid is greater than the resistance offered to the evolution of the second, force is produced."

If chemical action shall produce force, I should think the first indispensable condition must be that a chemical action should be present; but I do not see any chemical action, as I have explained before. There is no chemical action, if we immerse amalgamated zinc in dilute sulphuric acid, or if we put unamalgamated zinc in salt water. In this latter case, a slow action might take place, by the oxygen and carbonic acid of the atmospheric air, which, in the course of a few days, might assist the zinc to deprive the chloride of sodium of a part of its chlorine, changing it into carbonic of soda; but the action of the battery is instantaneous, therefore the above action, requiring days to take place, can here not be taken into any account. What Mr. Smee says about the negative plate being useless, is contradicted by himself, having shown that the larger the negative plate, the more electricity will be produced.

Now, I think if both the antecedents are wrong, the conclusion arrived at is equally wrong, and without any foundation whatever. The chemical affinity he speaks of does not exist, because no living chemist will say that zinc has more affinity for chlorine than sodium, the latter being one of the most positive metals in existence.

Mr. Smee brings, then, what he considers to be the most powerful argument of his theory as follows:

"It immediately occurred to me that some metals might be made to reduce from a solution of one of their own salts metal of the same description, by placing the metal partly in a solution, for one element of which it has great affinity, and partly in a solution of one of its salts. This was actually found to take place," etc., etc.

I am astonished that this fact should have occurred to Mr. Smee, after it did occur a great many years ago to many other men, as I can prove by several of the oldest works on galvanic electricity.

I have just at hand a work published at Vienna, by Dr. Benjamin Scholz, more than twenty years previous to Mr. Smee's. Dr. Scholz says as follows:

"If we pour water gently on the top of metallic solutions, so that the two fluids do not intermingle, but form two separate layers, and we put through both these layers a rod of the same metal contained in the solution, we obtain a kind of galvanic battery; for instance: a solution of chloride of tin, water, and metallic tin; nitrate of silver, water, and a silver wire; a solution of sugar of lead, water, and a strip of lead. The electricity evolved will manifest itself by the metal being dissolved in its contact with the metallic solution, and being again deposited as a metal in its contact with the water, near the meeting point of the two fluids."

[To be Continued.]

CAUSE OF RAIN AND HAIL.—An interesting essay on the cause of hail and rain has just been laid before the French Academy, by M. Renon. Rain and hail, according to the writer, are produced in the same way—viz., by the passage of a snow-cloud, or cirrus, through a vapor-cloud, or cumulus. The cirrus is generally situated at a height of nearly 7,000 yards above the earth, and consists of fine particles of congealed vapor. Under certain conditions it falls through the cumulus, which is generally at a much lower level, and in so doing it adds to the water the latter contains, and by abstracting its heat converts it into rain. If the abstraction of heat goes on to any great extent, the particles of water become frozen, and fall on the earth as hail.

As, as a general rule, makes the ground hotter and the bad worse.

[Written for the Mining and Scientific Press.]

From Meadow Lake, Nevada County.

MESSRS. EDITORS:—The fame of this region is transcending that of any mining district on the Pacific coast. The wildest enthusiasm pervades the minds of present settlers, and dreams of untold wealth are directing the tide of an immense immigration to this place. The sober considerations of reason are laid somewhat aside, and extravagant hopes are busy in leading the minds of the people astray. This is a new country in every respect, of the wildest and most rugged formation, and presents the strangest questions as to its character. But little is yet known of the mineral deposits here. The character of the quartz is different from any ever before found, and present acquired knowledge is of little use in working it. The oldest and most experienced operators in quartz acknowledge themselves at a loss to describe the nature and quality of the rock found in the ledges of this district. From the entire strangeness of the mineral deposit arises questions as to its extent and permanency that can only be settled by future labor. The wildest hopes now filling the minds of people here are found on surface indications; for not a single ledge has proven to be a *bona fide* mine. There are several mills here, but they have done nothing but crush a few tons of surface rock, which has, however, yielded gold in very flattering amounts. But the history of California quartz mining is full of instances where the finest indications have proven most false, and while such indications are to be well tested, they certainly present no base for such extravagant hopes as are now occupying the minds of the people in this district.

CHARACTER OF COUNTRY.

Wild and rugged as the Sierras are, no portion exceeds this region. Mountains of solid rock rise on every side, presenting scenes of savage grandeur which certainly cannot be surpassed by the famed mountains of the older world. In the midst of the most irregular and rugged places the ledges of quartz extend, piercing in some instances the face of almost inaccessible precipices, and at all times lying between walls of synite, hard as iron. In position the ledges here are the most unfavorable of any on the coast; a very few near the town are tolerable easy of access, but the greater amount of them are on "Old Man Mountain," one of the roughest peaks on the range. It is almost of solid granite or gneiss from base to summit, and rises in a series of precipices that present a splendid picture to the lover of the wild and terrible, but no very pleasant view to him who will be compelled to overcome the roughness of the slopes before the mines can be worked. The mountain in height is said to be about 9,000 feet, and at the very summit some of the ledges that, prospectively, are the most valuable are located. The ledges seem to follow the rise and depression of the general formation. They are easily traced up the mountain side, and can be distinguished at a great distance, from the difference of color, from the masses of gneiss that wall them in. Much could be written about general features, but space forbids. Time alone can unravel the wonderful and strange characteristics of this section, and will in the future settle the present experiment.

THE CALIFORNIA MILL AND MINE.

Is situated about half a mile south of the town, on the Knickerhocker ledge. It was built in December last by the California Mining Company. The mill is of 8-stamp capacity, and is a very fine arrangement in regard to structure and finish. A fine engine, of 35-horse power and 26-inch stroke, drives the machinery, and affords all the power at present necessary. Copper plates are used, and also three amalgamators. The ledge runs southeast by southwest. Above it a tunnel eighty feet in length has been extended, which is expected to strike the ledge in about twenty feet. The quartz found is of dark iron color, filled with sulphurets of different kinds, among which most prominent are sulphurets of iron, copper and arsenic. One run has been made at the mill from surface rock, which yielded \$39.88 per ton. Four

tons were crushed. The gold brick was shown me by Mr. J. K. Stewart, the accommodating superintendent, which was stamped \$159.91. The gold contains silver, and is worth some \$16 per ounce.

WINTON'S MILL.

Just below the California, on the south, was built last summer by the present owner, Mr. N. W. Winton, a gentleman well known to the political and mining circles of Nevada State. The mill at present contains only five stamps of 750 pounds weight, but the foundation for ten stamps has been laid, and they will be erected this season. The engine is 25-horse power, built at the Vulcan Works, San Francisco, in good condition, and fully sufficient for all power needed. Wheeler & Randall's amalgamators are used—three in number. Some considerable work has been done in this mill, but it is not in operation at present. The silver process has been the mode of treating rock, but it has been found too expensive, and changes are being made to work it by different methods. The practical miners here are fearful that the quartz is of a difficult character, and will present many unfavorable features that must be overcome. Belonging to the mill are four lodes—the Indian Boy, R. M. Star, and Seneca. But little work has been done on the lodes, and, consequently, but little known of their value. On the Indian Boy a shaft forty feet deep has been sunk, and a cut thirty-five feet in length by fifteen feet in depth has been extended on the ledge. From the ledge some very rich ore has been taken. The quartz is hard, of dark tinge, similar to rusty iron, and filled with sulphurets of different kinds of iron, and arsenic being the principal ones. The yield of free gold was \$20 per ton. The rock requires roasting before crushing. Sodium-amalgam has been used very successfully at this mill. The operations of the mill will commence soon, and the energy of the proprietor will keep it in steady motion during the summer. Since writing the above, I have been informed that the mill has been leased by the Mohawk and Montreal company for two months, they paying \$600 per month rent.

ENTERPRISE MINE AND MILL

Is situated about six miles southeast from Meadow Lake, between the forks of the South Yuba. It is about three miles north from Cisco, an intended station of the Pacific Railroad. The mine is near the summit of a granite hill, at an elevation of some five or six thousand feet. The ledge, one of the largest I have ever seen, extends northeast by southwest, in a caving of hard granite. The eastern wall has been found, but the western is not in sight. The cut on the ledge is forty feet wide, from which some two or three thousand tons of rich ore has been taken. Last year some ten tons of it were sold to a gentleman in San Francisco, for fifty cents per pound, an extravagant price seemingly, yet it will not seem so when you are told that it yielded \$5,000 per ton throughout. The lowest ore worked from the surface yielded \$101 per ton. The richness of the ore is increasing as the lead descends. This rock is of a blue and grey cast, holding a great quantity of blue sulphurets, which are very rich in gold. The blue quartz is the richest, far exceeding the grey in yield. The company own 1,500 feet on the ledge. Rock is now being sacked, preparatory to being sent to Swansea. The superintendent of this mine is Mr. Warren Rose, an experienced miner from the silver leads of Nevada. The mill connected with the mine is owned by a separate company altogether, who crush by the ton. It is owned by Messrs. Goss & Lambert, of Sacramento. An outside view presents no very handsome appearances, as it is built of rough logs. The reason of this is, that at the time it was built no lumber could be obtained, the snow being ten or fifteen feet deep. On the principle that there is nothing in appearances, this mill will pass as a good concern. The frame-work inside is so constructed that the walls can be pulled down and constructed anew without interfering with the structure of machinery. The principal feature of interest in this mill is the New Enterprise Pulverizer, built by Mr. G. W. King, a gentleman of extensive experience in mining machinery. It consists of three large cast iron wheels $5\frac{1}{2}$ feet in diameter, of 3,000 pounds weight, attached to a perpendicular shaft, around which they revolve on a circular plate twenty-five feet in circumference. This rock, after being broken into small particles by Blake's rock crusher, is thrown into a hopper, which, by means of three feeding pipes, places the rock on the plate. After one revolution of the wheel the dust is scraped by self-acting scrapers into a receiver in the middle of the circular plates, from which elevators carry it to sieves, where it is bolted, the fine dust passing to amalgamators, and the coarser again to the hopper, to be crushed over. The inventor claims that these wheels will outcrush any 30-stamp mill on the coast. If such is a fact it will be one of the best inventions that could be possibly made, for the jar and wear of stamps

will be laid aside, and not one-tenth this power is necessary to drive them that would be required to drive a battery of thirty stamps. An engine of 5-horse power is all the power necessary for the pulverizer. The mill will be refitted with new amalgamators and other machinery during the summer, and be prepared to do constant work. The desulphurizer mentioned in the Press a few numbers ago, has been torn down and thrown out-doors as a useless concern. The amalgamators to be used are Wheeler & Randall's new pans.

Time and space forbids mention of more claims. As there are many ledges here that deserve notice, in my next I shall give them a chance. W.

Meadow Lake, June 21, 1866.

Bruckner's Mechanical Roasting Furnace.

This invention, which we have frequently mentioned before, is reported by one of the Nevada State papers, to be a success upon a practical trial. The following, published recently in the Virginia City Enterprise, gives a fair idea of the apparatus:

We paid a visit yesterday afternoon to the Central mill, in this city, for the purpose of seeing Bruckner's roasting furnace operate. This newly-invented furnace is simply a horizontal revolving cylinder, nine feet in length by three feet in diameter, and made of heavy boiler iron, with a fire-place at one end, from whence the heat passes through a flue into the cylinder and out at the other end. The charge of dry crushed ore for this furnace is 1,000 pounds, which is thoroughly roasted in the average time of three hours. The ore is introduced into the cylinder by means of a square hole in the side, and when completely roasted it is emptied out through the same aperture. By means of an inclined partition, placed diagonally along the center of the cylinder and nearly to each end of it, the ore is made to pass constantly from one end to the other while it is revolving, thus equalizing the heat, and consequently the roasting. The cylinder rests on a set of iron wheels at each end, and is made to revolve at the rate of about once per minute by means of cog gearing. This furnace has been in operation but a few days, but yet quite long enough to demonstrate it to be a perfect success. The heat, after passing through the furnace, passes into a condensing chamber of brick, by means of which wet ore can be dried. Thus, it is not requisite that the ore should be dry crushed for this furnace, which is quite a saving to the capacity and wear and tear of the mill stamps. Two men can attend to five of these furnaces easily in twenty-four hours, the amount of wood consumed during that length of time being only about three-quarters of a cord. The working capacity of the furnace is estimated to be from three to eight tons in twenty-four hours, according to the character of the ore. Wet crushing and amalgamating, without roasting, gives at present an average working yield of sixty per cent. of the assaying value, at a cost of fifteen dollars per ton, while the crushing, roasting and amalgamating process will give a yield of eighty per cent. of the assay value, at an additional cost of from five to eight dollars per ton. From the above it will be seen that forty dollar ores, and all of higher value, will pay for roasting. If this furnace performs all it promises—and we believe it will—it is destined to be an important auxiliary to the working of ores, and greatly enhance the yield of our mines. The furnace can be seen in operation at the Central mill by all interested in such matters.

DESULPHURIZING COAL.—Mr. Charles F. Denner, who for twelve years was the active agent of the Colt's Fire-arms Factory Company in New York, is about introducing a new method for the treatment of coal, which has been pronounced a decided success. The coal prepared by the new process, which is very simple and cheap, is said to be far superior to coke for melting iron, etc. A much hotter fire can be made with it than with coke. Cast-steel heated by coal thus treated has been welded without the use of borax or other ingredients. Pig-iron which has proved too hard, has been found to yield and produce as good work as turned out with some of the best brands of iron. Crystallized iron, after melting once or twice in a cupola with the desulphurized coal prepared by the new art, has been found to work exceedingly well. The whole apparatus and ingredients to treat 100 bushels of coal can be put up for from £5 to £10, and it is stated that 60 bushels prepared by this process give as much heat as 85 bushels of the best coal not so prepared. The coal burns with a bright and violent blaze, and for family use effectually gets rid of the smoky, smouldering fires, and substitutes one of a bright and cheerful character. To smiths' and manufacturing establishments, where large and strong fires are kept up, it is proposed to grant rights for usage at such low rates as to insure its general adoption, and do away in a great measure with the smoke nuisances that is so injurious everywhere.

Mechanical.

The Art of Soldering.

Soldering is the art of melting the surface of metals together by partial fusion, and the insertion of an alloy between the edges, which is called solder, it being more fusible than the metals which it unites. Solders are distinguished as hard and soft, according to their difficulty of fusion. Hard solders usually melt only at a red heat, but soft solders fuse at a lower temperature. In applying solder it is of the utmost importance that the edges to be united should be chemically clean—free from oxyd—and they should be protected from the air by some flux. The common fluxes used in soldering are borax, sal-ammoniac, and resin. Hard silver solder is composed of four parts of fine silver and one of copper, made into an alloy and rolled into sheets. It is quite difficult of fusion. Soft silver solder is composed of two parts of silver, one part of brass, and a little arsenic, which is added at the last moment in melting them. It will be understood that these alloys are commonly run into convenient bars or strips for use. Silver solders are used for soldering silver work, gold, steel, and gun metal. A nearer seam is produced with it than soft solders. It is commonly fused with the blow-pipe. A strip of thin silver solder is laid on the joint to be closed; the blow-pipe is brought to bear upon it, when it melts and runs into the joint filling it up completely. Button solder is employed to solder white metals, such as mixtures of copper and tin. It is composed of tin ten parts, copper six, brass four. The copper and brass are first melted, then the tin is added. When the whole is melted the mixture is stirred, then poured into cold water and granulated, then dried and pulverized in a mortar for use. This is called granulated solder. If two parts of zinc are added to this alloy, it makes a more fusible solder. Fine gold cut into shreds is employed as a solder for joining the parts of chemical apparatus made of platinum. Copper cut into shreds is used as a solder for iron. Hard silver solders are frequently reduced to powder, and used in that condition. Soft solder consists of two parts of tin and one of lead. An excellent solder is made of equal parts of Banca tin and pure lead. It is used for soldering tin plates, and, if well made, it never fails. The following is a useful table of solders with their fusing points:

No.	Parts of Tin.	Lead.	Melting deg. F.
1	1	25	558
2	1	10	541
3	1	5	511
4	1	3	482
5	1	2	441
6	1	1	370
7	1½	1	354
8	2	1	340
9	3	1	356
10	4	1	355
11	5	1	378
12	6	1	381
13	4	1 Elsmuth	320
14	3	2 1 "	310
15	2	2 1 "	262
16	1	1 1 "	254
17	1	2 1 "	236
18	5	3 1 "	202

The alloy No. 8 is used sometimes for soldering cast iron and steel; the flux used for this purpose is sal-ammoniac, but common resin may be employed. Gold and silver are sometimes soldered with pure tin and a flux of resin. Copper, brass, and gun-metal are soldered with No. 8 and a flux of rosin or sal-ammoniac. The chlorids of zinc is used for soldering sheet and plate iron as a flux with the same solder. Lead and tin pipes are soldered by plumbers with Nos. 6, 7, and 8, and a flux of resin and sweet oil. In soldering with soft brass, the ends of the articles to be soldered are secured together by a wire, and granulated solder and powdered borax are mixed in a cup with a small quantity of water, and spread along the joints with a spoon. The article is then placed in a clear fire, and the solder melts at a red heat, when the article is then removed from the fire. In soldering small articles with the blow-pipe, they are supported on a piece of charcoal, or, what is better, pumice-stone, and the flame is ejected upon this solder. In soldering lead pipes the parts to which the solder is not to be attached are usually covered with a mixture of lampblack and size. In soldering any article, care must be exercised to have the edges of the plates or articles perfectly clean, or the solder will not adhere. A flux is employed for the purpose of preventing oxydation. Resin and sal-ammoniac, powdered and mixed together, makes a good flux for copper and sheet-iron soldering. In other cases, a strong solution of sal-ammoniac is used to moisten the edges of the joint, then the resin is sprinkled upon it, and the solder applied. The chloride of zinc is made by dissolving pieces of zinc in muriatic acid. It is well adapted for soldering zinc plates and pipes, and is employed with a brush to moisten the edge of the article to be soldered. The solder is then applied in the usual way with a tool. Zinc is a very difficult metal to solder, because it is so easily coated with oxyd, and it also volatilizes with heat.—*London Chemical News.*

STEEL BOILERS.—Important experiments have been made in Prussia with steel boilers. Two boilers, each sixty-eight feet long by four in diameter, without flues, were placed side by side. One was made of steel plates half an inch thick, the other of iron plates of 0.415 of an inch in thickness. The steel boiler was tested by hydraulic pressures of 135 pounds per square inch. Both boilers were worked for about a year and a half under sixty five pound pressure. At the end of that time there was less scale in the steel than in the iron boiler. The steel boiler generated twenty five per cent. more steam, and evaporated an average of 11.65 cubic feet of water per hour; the iron evaporated 9.37 cubic feet. The quantity of coal consumed per twelve hours was 2,806 pounds for the steel and 2,972 for the iron boiler. The plates of the steel boiler directly over the fire, were found to be uninjured, while those of the other were worn out. The advantages of the steam boiler are strength, lightness, rapidity of evaporation, durability under heat, the security of more perfect riveting and comparative freedom from scale.

M. AUSTRE ACHARD, of France, has just been awarded the Montyon prize of the year for the discovery of his electric railway brakes. This apparatus places at the immediate disposal of the engineer on the locomotive complete control of all the brakes of the train at once. Without any assistance, and by aid only of a handle or winch and of an electric wire, he can tighten all the brakes in a second. It has been proved upon the Strasburg and Paris line, with trains going at eighty, ninety and even ninety-five kilometres an hour, this method will bring the train to a stop within a distance of two or three hundred yards, whereas the old method required twelve hundred yards to stop a train going at such speed. The electric brake is also in use in Belgium.

NEW AMALGAMATOR.—The Montana Post describes as follows a new amalgamator recently invented by William Cowie, of Montana: It consists of a horizontal cylinder, the upper half of which is provided with hinges, so that it can be drawn back when required for a clean up. Revolving, also, horizontally, through its entire length, is a shaft carrying plates arranged like an Archimedeal screw, and connected by floats which dash the contents of the machine against every part of the interior of the cylinder and of the plates. The whole of the amalgamator is made of copper, and the interior coated with quicksilver. The rotation of the shaft brings the quartz reduced by the stamps to pulp, in contact with successive amalgamated surfaces, ensuring, as far as mechanical action can, the complete saving of the gold. The tailings escape at the opposite end of the machine from that at which they enter fresh from the stamps.

FOR FASTENING BUTTONS.—The Portland Argus says that Capt. J. J. Boyd has secured a patent which will make a complete revolution in applying buttons to garments. By this invention buttons can be attached to any part of wearing apparel without the use of thread. The invention consists solely in making the button with a spiral wire to be inserted into the cloth like a corkscrew, and then pressed down flat so as to form a ring to hold the button in place.

"THE THUNDERBOLT."—A new sporting rifle, with the above euphonious name, has been recently perfected by Messrs. Howard Brothers, of New Haven, Conn., which is said to eclipse all similar fire-arms that have gone before. They are now manufacturing fifty per day. Their New York office is at 387 Broadway, where particulars can be learned, or a descriptive pamphlet can be obtained. The cost of the gun is twenty-five dollars.

NITRO-GLYCERINE was first prepared by Sombrero, about twenty years ago, in the laboratory of Pelouze, Paris. Its enormous explosive force was discovered at the same time, but the danger attending its preparation deferred investigators from entering the field of research, until Mr. Alfred Nobel had the intrepidity to introduce it on a large scale to the public as a substitute for blasting powder or gun cotton.

WHO FIRST USED COAL.—The Belgians claim to have been the first to discover the uses of coal; and this discovery, they say, was made by one Hullos, a blacksmith of the village of Plenevaux, near Liege, in the year 1049, from whose name they derive the word "houille."

A very simple invention was exhibited at the late Birmingham Cattle Show for making butter by atmospheric action, the air being forced by a plunger into the midst of the milk or cream, which is contained in a cylinder, the result being in a few minutes butter is made, leaving the milk perfectly sweet for family use.

SALES OF THE WEEK

BY THE S. F. STOCK & EXCHANGE BOARD

Friday, June 29.

AFTERNOON SESSION.

5 shs Savage at 900@985 per foot.
 96 shs Ophir at 200@213 per foot.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, July 7, 1866.

A very active demand for money prevailed at the close of last week, with heavy offerings in Bank, and throughout this week applications for discount have been rather more numerous than is usual between Steamer days. The requirements of the merchants are still upon an extended scale, owing to a desire to remit cash while the rates of exchange are so favorable. Rates of interest rule at 1@1½ % cent. per month, with less doing at the former rate than for some time past.

Receipts of treasure from the interior show a material increase, and during the week have amounted to fully \$1,000,000.

The bullion market was left bare upon the sailing of the last steamer, and since then all desirable lots have been freely taken at full rates. Gold bars may be quoted at 870@890, and silver at 1@1¼ % et premium for average grades.

The exports of treasure from this port during the first half of this year amounted to \$23,407,728, not including \$4,500,000 sent East by the U. S. Sub-Treasurer in this city since January 1st.

Legal Tender Notes have been dealt in to the extent of some \$50,000, receding from 71½c to 70½c, then selling at 71c, and closing at 71½c, asked. Latest telegraphic advices from the East quote gold at 153 on the 5th inst.

Considerable sales of San Francisco 6 % Bonds of 1868 were made at 68½@69¼, closing at 70 asked. U. S. 7-30's were sold at 74, and are now held at 75. Spring Valley Water is a shade better, and sold at \$62 per share, closing at 62½ hid.

The mining share market gives evidence of some strength, and although continued apathy prevails, nearly all stocks have been dealt in at enhanced figures, closing less firmly, however. The aggregate yield of leading claims last month, embracing the Yellow Jacket, Gould & Curry, Savage, Crown Point, Hale & Norcross, and Imperial mines, amounted to nearly \$800,000. During no like period within a year past, have the bullion receipts of these companies been larger.

Hale & Norcross met with no sale this week, but is well held at about \$1,400 per foot. Advices from this mine are exceedingly favorable. A connection has been made between the 700 foot and 535 foot levels, giving conclusive evidence of the existence of a formidable body of ore throughout that distance. The vein of ore on the 535 foot level is now 30 feet wide, most of which, it is thought, will mill \$45@50 per ton. From partial returns, the receipts of bullion last month exceeded \$75,000, and the full returns for June will probably increase the aggregate to \$100,000.

Savage rose from \$900 to \$917½, dropped to \$910, and sold yesterday at \$900. During the week ending June 30th, 771 tons of ore were extracted, and 696 tons were shipped, a large proportion being second class ore. The northwest extremity of the ore deposit has been reached in the 6th station, but in following the lode to the south-east, a very good face of ore in the extreme end has been met with. The winze from the 6th level is down some 50 feet, and there is no particular change to note. Receipts of bullion for the month of June amounted to \$130,000.

 5 shs Overman at 50 per share, h 5.

Crown Point fell from \$900 to \$805, then sold at \$810. During the week ending July 1st, 683 tons second and 12 tons of first-class ore were extracted. The ground in the lower drift is said to show some improvement. The yield of this mine last month amounted to about \$105,000.

Gould & Curry has been sold at \$705@706, closing at \$750 asked. We have been courteously furnished with the general account of the operations and expenses of this company for the half year ending May 31st, from which we glean the following details: During that period 33,705 tons of ore were extracted, and 33,057 tons shipped and reduced, yielding in the aggregate \$908,119—the company's mill turning out \$667,712. The extraction of this ore cost \$3.06 per ton; prospecting and dead work \$2.04; accessory work \$1.67; improvements, etc., 79c per ton; total cost of production \$7.56 per ton. The total cost of mining last year was \$10.86 per ton. From the company's mill, for the six months ending as above, the average yield per ton was \$36.90 per ton, at a cost of \$13.57 per ton, the latter being upon the amount amalgamated. If reckoned upon the amount of ore crushed as is usual in Washoe, the cost per ton would be \$11.22, adding for hauling 90c, making \$12.12 per ton. The receipts of this company for the month of June amounted to \$146,000.

Yellow Jacket is in less favor, and nearly 200 feet were dealt in, advancing from \$692½ to \$760, and selling yesterday at \$742@692½. No authentic data can be obtained this week, owing to the delinquency of certain officials in Nevada, but the receipts of bullion for the month of June are supposed to be in excess of \$260,000.

Ophir has also been in more request, steadily advancing from \$215 to \$258, and selling yesterday at \$230. In sinking from the floor of the south end of the 9th gallery, it is thought that a very considerable body of ore has been met with.

Chollar-Potosi rose from \$185 to \$230, dropped to \$200, and then sold at \$187@192. The Piute Station continues to look well, and the ore found in that and the New Santa Fe Station, adds considerably to the general average throughout the mine. During the week ending June 30th, 861 tons of ore were shipped to custom mills. There is nothing especially new to report in the different drifts from the new shaft.

Belcher rose from \$165 to \$195, receded to \$190, and closed yesterday at about \$190@180.

Imperial is meeting with more favor, advancing from \$162 to \$110, and selling at the close at \$108@107½. Recent developments with Holmes' ground are said to be promising. Receipts of bullion for the month of June amounted to \$61,000.

Overman, owing to the discovery of a small body of very rich ore, has been quite active at higher figures, advancing from \$23 to \$77½, receding to \$54, and selling at the close at \$60. Confidence rose from \$55 to \$70, fell to \$55, and then sold at \$57½. The assessment of \$25 per share, levied June 25th, has been rescinded. Bullion was dealt in at \$67½@55, closing at \$55 hid.

The total aggregate sales of Stocks, Legal Tender Notes and Bonds, since Saturday last, amounted to \$346,886.

[From the Golden State Iron Works Pattern List and Book.]

TABLE OF THE VALUE OF GOLD DUST.

Directions how to use these tables, so that any one may tell the value of his gold dust or lumps, from a single grain to a thousand ounces: Suppose your gold is worth \$15 an ounce, and you have 25 ounces, 17 penny-weights and 22 grains, of which you wish to know the value: Looking down the column of weights opposite 25 to the column of ounces, you will find \$375.00 to be the value of the 25 ozs.; opposite 17 in the column of dwts., \$12.75 for the dwts., and opposite 22 in the column of grs., .857 millics, or 69 cents for the grs., summing up \$388.64, which is the whole value of the gold.

Weight.	AT \$14.25.			AT \$15.00.			AT \$16.00.

HUTCHINSON'S
WINE AND CIDER MILL!

(PATENTED FEBRUARY 2d, 1863.)

FOR SIMPLICITY, COMPACTNESS, STRENGTH, ECONOMY OF
POWER, QUALITY AND QUANTITY OF WORK,
IT CHALLENGES COMPETITION.IT WILL CRUSH THE FRUIT PERFECTLY FINE AND NOT CRACK
A SEED, GRINDING TEN TONS OF GRAPES, BERRIES OR
TOMATOES, OR SIX TONS OF APPLES, PER DAY.

SOLE AGENT

FOR THE
PACIFIC COAST.

MANUFACTURED BY

WILLIAM B. KNOX,

At the GOLDEN STATE IRON WORKS,
19 FIRST STREET, SAN FRANCISCO.

Testimonial.

The "Scientific American," December 6th, 1862, in speak-
ing of this Mill, says:

"We have seen it at work, and can give personal testimony
as to its efficiency, having had it in operation in our office.
All the labor consists in turning the handle to grind the
apples into pomace or the grapes into must, as it is applied
to cider or wine manufacturing; the juice then flows, by the
combined operation of pressing and grinding, in a continuous
stream at the rate of a barrel an hour into the tub below."

MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the
MINING AND SCIENTIFIC PRESS and other San
Francisco Journals.]

NAME AND LOCATION.	AM'T OF ASSESSMENT.	DAY OF DELINQUENT SALE
--------------------	---------------------	------------------------

Mining Summary.

CALIFORNI.

Alpine County—

From the Silver Mountain *Bulletin* of June 23d, we clip the following items: The Balaclava vein is gradually increasing in thickness, and the ore improving. . . . The Pennsylvania are still cutting across their ledge, and are in some fifteen feet, without any indication as yet of a back wall. There is a portion of this ledge, called the "boulder strata," that yields by fire assay over \$600 per ton. . . . The Kohinoor company have been engaged, the forepart of this week, in constructing a road for the purpose of getting down ore to be worked. They are making good progress. . . . For the past two weeks Charles Uzay, Esq., assayer and metallurgist from San Francisco, has been testing ores from various ledges in our district, and the results obtained are, that we have three claims open, the ores from which yield by fire assay from \$250 up to \$467 per ton.

Amador County—

The *Ledger* of June 30th, says: The proprietors of the Coney lode at this place, have commenced sinking on their claim with very favorable results. As they go down the rock increases in richness and the vein widens. The rock they are now hoisting produces from a ton to a ton and a half of sulphurets per day, and these sulphurets are sold as fast as they are got out for one hundred and sixty dollars per ton, at the mill.

The *Dispatch* of same date has this item: We learn that Mr. S. W. Bright and others in this place, have found a very rich quartz vein near Scottsville, about a mile from Jackson. A shaft is being sunk on the lead, and the company will soon commence taking out rock for the purpose of having it crushed to test its worth.

Butte County—

The *Oroville Record* of June 16th, says: The work of erecting a mill on the Sherman ledge is now in progress and will be pushed to completion as rapidly as possible. The company have taken out and now have ready for crushing about 100 tons of rock.

Calaveras County—

The *Chronicle* of June 30th, says: Messrs. Gouldsen & Co's quartz mine, situated about one mile east of West Point, has proved to be one of the richest ever worked in Calaveras county. Eighty tons of rock from this claim, crushed at Smith's mill, yielded at the rate of one hundred and fifty dollars per ton, amounting in the aggregate to twelve thousand dollars. This amount of rock was taken from the mine, hauled to the mill and crushed, at an expense of less than eight hundred dollars, counting the labor of the owners, who are all working men, at four dollars per day for all labor performed.

The first lot of rock crushed from the new quartz mines at Railroad Flat, was taken from the Two Dollar Gulch ledge, and was crushed at the mill of Messrs. Harris & Co., at Sanby Gulch. Five tons of unassorted rock yielded at the rate of forty-five dollars per ton, and was taken from the mine at an expense of less than five dollars per ton. Add to this five dollars per ton for crushing and amalgamating in a mill at the lead, and a clear profit is realized of thirty-five dollars per ton.

Mr. Bevers' claim, at Rich Gulch, which has been worked by the last holders for three years past, only enough to hold it, promises to be extremely rich. He sunk a shaft two or three hundred feet from the old one, and at the depth of forty feet struck rock which astonishes every body in this region.

The San Andreas *Register* says: Mr. McGlynn has crushed five or six hundred tons of tailings for Wm. Mills, which are said to have paid about eight dollars per ton. He is now crushing some cement gravel, from an adjoining claim, which paid at the first clean-up, twenty dollars per ton. There is a large body of this gravel, and from present indications it will be a big thing.

El Dorado County—

The *Folsom Telegraph*, of June 30th, has this item: A short time since, T. Jenkins, and other Folsom miners, struck a very rich cement claim, at Weaver Hill, El Dorado county, that prospects from ten to fifteen cents to the pan. Already a tunnel is run in over one hundred feet. A mill is to be put up at once.

A quartz ledge near Clarksville, in El Dorado county, owned by E. G. Winchell and others, assays over \$200 per ton. The shaft is sunk fifty feet and quartz has been crushed for the past two weeks.

Humboldt County—

From the Trinity *Journal*, of June 14th, we clip the following: Irwin Davis Well, down 900 feet; have struck a small quantity of water. It is to be remembered that at this well they have not had any water down to this depth from its surface. . . . Jeffreys down 500 feet and upwards, with prospects rather improving. . . . The Ponner Farm, down 125 feet. Some say this company, at this considerable depth, have better prospects than the majority

of wells operated. . . . The Union Well yields a constant supply of oil, when pumped. We are not aware that they are any deeper than formerly mentioned.

The *Times* of 23d ult., says: The coal recently discovered near Areata, is stated by those who have tested it, to be of an excellent quality, fully equal to the best Cumberland coal. It ignites readily and burns freely.

Mariposa County—

The traveling correspondent of the *Flag*, writing from Hunter's Valley, says: "La Victoire, the most famous of the copper mines here, has a vein of ore which is, in some places, 160 feet wide. This mine is worth, perhaps, \$3,000,000; but it will not add much to the wealth of the State till the 'freeze-out' game now in progress shall be played out."

Nevada County—

The *Gazette* has the following items: M. W. Ross showed us some very handsome rock yesterday, taken from the Enterprise ledge, located some four miles above Omega, in this county. The rock is full of free gold and very rich and handsome sulphurets. . . . The mill at the Star Spangled Banner mine was started up again on Monday, having been stopped for some time for the purpose of putting in new pans. They have running now five Varney pans and two large settlers, and the ore is worked in the same manner as silver ore is worked in the mills at Virginia City. . . . On Saturday evening last, Robert Smith purchased of E. Henderson a one-eighth interest in the consolidated Wisconsin and Illinois claim, paying therefor \$8,000. Six weeks ago, an eighth interest in the same mine was sold for \$3,200. This claim is located near the Allison Ranch. . . . A waltzing or planetary pan, designed for the mill now being erected by the owners of the Eureka mine, at Grizzly Ridge, was taken out to the mill yesterday. . . . A conditional sale of the Prelus claims, at North Bloomfield, has been made for \$12,000. . . . Very rich specimens have been recently taken out of the quartz ledge in the rear of the National Exchange. Two or three shafts have been sunk, and the ledge traced a distance of about fifty feet. Three or four tons of rock has been raised to the surface, which we should judge would yield forty or fifty dollars a ton. It is called the Italian ledge. . . . The Star company have now commenced "breasting out," having backs sufficient to take out three or four hundred tons of rock. At the intersection of the tunnel with the ledge, they have commenced an incline, which will be opened and supplying rock by the time the above tunnel is exhausted. Men were sent up a few days ago to put the mill in running order, and when once started it is the intention to keep it running without interruption.

The Grass Valley *Union* says: From an ounce and a half of rock taken from the celebrated Stockton ledge, crushed in a common mortar yesterday morning, one dollar and seventy-five cents was realized. The rock was not selected, but taken promiscuously from a pile that lay on the ground. . . . We saw yesterday afternoon, at the office of Wells, Fargo & Co., three massive bars of gold, which had just been brought in from the Eureka mine. These bars or bricks were valued at ten thousand dollars each, and were the results of twelve days yield of that extraordinary claim.

The *National* has these items: Capt. S. W. Lee informs us that work at the Ophir mill has been suspended for a week or ten days, in order to make a change in the amalgamating pans and other repairs necessary. . . . The lone mine still continues to yield handsomely. The company are now working at a depth of about 170 feet below the surface of the ground, on the second level. They intend to go about thirty feet further down, when they will begin work on the third level. A gold bar worth \$5,000, was the result of two days' run of the mill. . . . A gold brick, valued at about \$6,000, was shipped yesterday, from the banking house of Findley & Co., the gold being the proceeds of a few days' run from the Socky mine.

The *Transcript* says: A new shaft, three by six feet has been sunk in the Big Blue ledge fifty-five feet, and is now opened into the old tunnel. A fine engine for hoisting and pumping is being put up, which will be completed in about three weeks. The company will then commence taking out rock. . . . Yesterday a splendid ledge was struck in the vicinity of Gold Flat. The rock from the croppings, shows lots of free gold, and it is estimated by those who have examined it that it will pay fifty or sixty dollars to the ton. It has been named the P. P. ledge. . . . S. F. Butterworth, Superintendent of the Almaden quicksilver mine; L. L. Robinson, of Pioche & Co., and a number of capitalists, have purchased several extensive gravel claims upon Humbug creek, near the town of North Bloomfield. One set of claims were purchased for \$200,000, and an adjoining set brought \$150,000.

The Dutch Flat *Enquirer* has the following in regard to the progress of cement mining in Little York township. During the time that Brown Brothers, of You Bet, have been run-

ning their mill, they have averaged about twenty-three hundred dollars for every ninety hours. Last week they cleaned up twenty-three hundred, yet there were occasions that they have realized as high as forty-five hundred for a little over four days and nights, and we believe never less than seventeen hundred since their mill was put in good running order. Niece & West are also doing a good business, their claim and mill being located near the Brown mill, and yielding equally as well, as are in fact all the mills engaged in crushing cement, either in the locality of You Bet, Red Dog or Indiana Hill, in our own county.

Excelsior.—The *Gazette* says: Five tons of Enterprise rock has been shipped to Swansea, on which the company received an advance in San Francisco of \$110 a ton, and five tons worked at the French mill in this place, which yielded \$700, besides the tailings. Twenty-four hundred pounds of the rock has been sold at the mine for \$1,322, or over half a dollar a pound.

The Meadow Lake *Sun* says it is estimated that there are now employed in the mines of that district over three hundred men, and it is confidently asserted that this force will swell to two thousand within sixty days.

Placer County—

The *Stars and Stripes*, of June 27th, says: A shaft sunk on the Boulder ledge, to the depth of fifty feet on the side of the hill, struck the ledge three feet wide about 130 feet below the croppings. The rock looks well, and the mine is one of the most promising in the Ophir district.

The *Herald*, of the 30th, has the following: Within a few weeks, four or five different locations have been made and companies organized, in this district, from one to two miles north of town, by Nevada county prospectors. The locators, who are all working men, and practical miners, are confident that this section of country offers superior inducements to quartz men.

Plumas County—

The Quincy *Union*, of June 30th, has these items: The Crescent Company, Indian Valley, are getting large returns from their mine. . . . The Preminn and Plumas are crushing rock in one of the Crescent Company's mills. This, also, is paying handsomely. . . . Judkins & Kellogg started the old Round Valley mill on Wednesday last. They crush rock from the Kittle ledge, which already shows well. . . . The Caledonia Company, on the extension of the Kittle, are crushing their quartz in the Dixie mill, and are getting good pay. . . . The Green Mountain ledge, in the same locality, is also paying well. . . . The Wiles mill is working quartz from the old Wiles ledge, with good success. . . . The Murphy & Company ledge, an extension of the Pennsylvania, was lately discovered, and shows a width of nine feet, and gold visible to the naked eye. . . . Waterworth & Trucks are running their mill on rock from their lower tunnel, with pay beyond their anticipations. . . . The Indian Valley Company are making better pay than ever heretofore. . . . Bidwell & Company have sunk a shaft on their Union ledge, an extension of the Indian Valley, two hundred feet deep, and will strike the ledge in a few days. . . . Bidwell, Meginnis & Co., are crushing rock from the Meginnis ledge, with fine success. . . . The Cosmopolitan Copper Company, at Geessee Valley, are within five feet of their ledge, already getting large lumps of rich copper sulphurets. . . . The Peacock Company are packing their copper ore to Chapman's Smelting Works, which will be fired up in a short time. . . . The Gifford Company were offered \$10,000 for five-sixths of their copper ledge, a few days since, which they refused. . . . Lovejoy & Jackson, Kelly & Co., and Bickford Bros., on Grizzly Creek placer mines, are all busy and doing well.

Shasta County—

The *Courier*, of June 30th, has these items: Four new lodes have been discovered and located in South Fork district. Two of them, the Cincinnati and Tewanau, show very rich. The first named is about fifteen inches wide, and shows good mineral clear across and down some three or four feet—as far as sunk. . . . The Chicago has been stripped over a thousand feet. For that distance, the ledge shows the same as when first opened. . . . The Mammoth mill will soon be running on rock from the Harrison lode, at Quartz Hill. There is already out fifty tons of first-class rock, from any of which good prospects can be obtained by the mortar and pan process.

Sierra County—

The Downieville *Messenger*, of June 30th, says: There is considerable excitement at Poker Flat, over a rich quartz lead lately discovered there. The ledge is called the Meredith, and although the rock shows no free gold, every ounce is shown extremely rich when once crushed. A large number of locations were made. . . . The Sailor company has a tunnel in some 75 or 80 feet. They will commence crushing in a few days. . . . The Lone Star, at Pine Grove, has lately got into a new range of pay that yields much richer than usual. One day lately one of the men found a small

boulder in which about an ounce of gold was visible, and on pounding it up, panned out one hundred and eighteen dollars and eighty-nine cents. . . . The first meeting of the Central Sierra Quartz Prospecting Association is to be held July 7th. The object of the Association is to further the quartz interests of the county in a more effectual manner than it is likely to be done by private enterprises.

The total amount which has been taken from the Eureka mine, 25 miles north of Downieville, is said to be over \$1,400,000.

Siskiyou County—

The Yreka *Union* says: The mines on Humbug are paying well. The miners have plenty of water, and have made some big "clean ups" lately.

A very rich lead of gold-bearing quartz has been discovered in Siskiyou county. Free gold can be seen by the naked eye in most of the rock. The average yield is \$600 per ton in gold and \$30 in silver.—R. B. Independent.

Trinity County—

The *Journal* of the 30th of June says: The Pony Creek diggings, at New River, are yielding rich returns. The two Portuguese miners, who bought the claim of O'Brien and McIlvane last winter, for \$1,200, have a regular daily income from it of fifty to sixty dollars. Our old friend Foulke is having a good time all to himself, in his claim, which is good for fifteen dollars a day.

Tulare County—

From the Havilah correspondence of the Mariposa *Free Press*, we gather the following items: Piper's mill has suspended operations for a time. . . . Several others in the vicinity are in successful operation. . . . The Piute district is turning out rich. . . . At Agua Caliente several parties are working with arrastras, among them, Tangate & Worthington, formerly of Mariposa. I visited the Joe Walker vein this morning. They are down 106 feet with their shaft, and have a good, well-defined vein, varying in thickness from three to seven or eight feet.

Tuolumne County—

The *Courier*, of June 30th, has these items: Less than five tons of rock taken from the Birchfield claim, near Uniontown, last week, yielded forty-two ounces. . . . The Excelsior mill is being put in prime order by Mr. Owen, who is adding another pan and settler. It will be running again in a few days. . . . The Sonora Gold Company's new mill, on Bald Mountain, started up on Thursday. Everything goes like a clock, and the proprietors express satisfaction. . . . The Old Mississippi claim, in Wood's Creek, has been improved in its working facilities by the erection of a derrick and water-power, for hoisting. This has been a rich placer claim. . . . The Mount Vernon mine has of late been "giving out" after the way and manner of the days of yore. Last week we saw ten pounds of retorted gold from this mine, which was obtained from thirteen tons of rock. Last Tuesday we saw thirteen pounds of the precious metal from the same source—the proceeds of fifteen tons of rock.

Yuba County—

Another engine of 60-horse power is to be added to the one of 30, already running in the works of the Jefferson company.

NEVADA.

Washoe—

The Gold Hill *News* of the 23d June says: The Yellow Jacket company, yesterday, in their north shaft—old works—at their 520-foot level, struck a most extraordinary and very rich deposit of ore, for the Comstock lode. Gold perforated, and was to be seen all through this rock, and its assay per ton must be enormous. . . . At the Union mill carpenters have been engaged for a long time in getting out, framing, and otherwise preparing the timbers for the new battery about being introduced in this mill. Twelve stamps are now worked, and for some time past the mill has been running on Chollar-Potosi rock. The crushing capacity of the battery is from twelve to sixteen tons per twenty-four hours.

Reese River—

The *Reveille* says: There is at this time but little doing at Silver Peak; but such a condition cannot long endure. There is ore here of the highest grade in surprising quantities, and easily attainable. I learn that the Grand Salt Basin company will soon commence building roasting furnaces, preparatory to starting their mill again, and expect before another year to lay the foundation for one of the most costly reduction works in the State, with tramways from the mines to the mill, involving an expenditure of from one to two millions. . . . The little 3-stamp mill at Red Mountain is again at work upon gold-bearing rock, averaging a yield of eighty dollars per ton. . . . The New York and Silver Peak company, it is said, are soon to commence operations upon their mill again, having purchased in San Francisco the machinery for a first class 40-stamp mill. . . . The Pioneer mill was to commence on July 1st, on ore from the Lee, Potomac, etc. . . . The machinery from the Richland mine had arrived. . . . The Asteroid has an incline down 150 feet, and three shifts of laborers are daily em-

played... The Stirling mill is at present idle. ... A short distance below the Stirling, upon the same creek, is the eligible mill-site of the New England and Nevada Silver Mining company. A number of men are at work grading for the foundation of the mill. The contract for building is already let, and it is expected to be in motion the coming autumn. It will have thirty stamps, three Wheeler pans, and two ransing furnaces. ... From Mr. Spron, who has just returned from White Pine, we learn that some important discoveries have been made upon the eastern slope of the mountains constituting the district—the first locations having all been made upon the western side. The ledges are two to four foot thick. ... The Uncle Sam is fully ten feet thick, two or three feet being extremely rich ore. ... Philadelphia District No. 3 will soon have a mill running at Belmont. Fuel and water are plenty. Col. Noel is now engaged in erecting the mill which he moved from Big Creek.

The Nye county *News* of June 23d has these items: An assay of ore from the New York ledge, Palmetto district, about twenty-five miles south of Silver Peak, gives \$50.22 in gold, and \$916.11 in silver, making \$966.33 per ton. ... Twin River district promises to be soon the most lively of any in the State. The Murphy company have a large force upon their mill and mine, and are pushing matters with all possible speed. We were shown some fine specimens of top rock, from a recent location made by Mr. Gillette, which is nine feet in width, and assays \$111 per ton. The Autocrat, also, is well spoken of.

Esmeralda—

The Union of 23d June, says: The Real Del Monte mill, during the past three weeks, has crushed a large amount of rock taken from several ledges in this district—also some five tons of tailings from the Wide West mill.

Columbus Ore.—A gentleman of this place has handed us a letter from a friend in Austin, which may be interesting to the mining community. He says, "2,400 pounds of ore were crushed dry in a 5-stamp battery of 500 pound stamps, in the short time of four hours and three-quarters. Samples of pulp taken every ten minutes, gave an assay from the Northern Belle lode of \$188.22 per ton. Samples of pulp taken from the Mt. Potosi lodes, gave an assay of \$95 per ton in silver."

Humboldt—

From the *Register* of June 23d, we clip the following: John C. Fall, Superintendent, dispatched, by Wells, Fargo & Co., Monday, two handsome bricks of bullion, as first installment of first dividend to the credit of the Pioneer & Inskip mining and mill company, of New York. The two bricks were 2,142 ounces in weight; were not assayed, but estimated at one dollar the ounce. An amalgam now in retort will yield about as much more—all which goes as a dividend to the Pioneer & Inskip.

Black Rock—

The evening *Tribune* of June 30th, says: From a private letter just received from a gentleman in Washoe City, we learn of the discovery of very rich quartz ledges near Black Rock, ninety miles northeast from Honey Lake Valley. A lot of 3,800 pounds yielded \$22.82 or about \$50 per ton. The other lots, which were worked at Dall's mill, yielded as follows: High Rock, per ton, \$217; Merrimack, test of 3,800 pounds, \$48.95; Monadnock, per ton, worked, \$256; Monadnock rock, per ton, assayed, \$358.50; Eureka, worked, \$157; Ruby, worked, \$200; Burmese, worked, \$147; Summit Sierras, worked, \$36; tin ore 42 to 82½ per cent.

ARIZONA.

The *Alta's* correspondent writes from Mohave City, June 14th: "In regard to the mines, prospects were never so bright as at present. The San Francisco district is taking the lead. Mr. Hardy is vigorously prosecuting work on the 'Parsons' lode, running two tunnels into the mountain through which the lode runs, one of which is now in 400 feet. The tunnels have already crossed small veins of quartz that are invariably rich. The Queen of the Pacific Company, on the same lode, are taking out some rich rock, that will work \$125 per ton, nearly all gold. Their tunnel is in 130 feet, and has struck the vein at a depth of fifty feet."

The Morse Association, of New York, are now developing the famous Moss lode; have about forty men employed, and will soon have the mine in a paying condition. They have about 250 tons of ore out ready for the mill, some of which is very rich. They have a shaft down 100 feet from the top of the croppings, and drifts running in different directions from its lowest depth—the one east, some twelve feet, discovers some of the finest specimens of gold-bearing quartz it has ever been my fortune to see. Bags of it have been shipped to their agent in San Francisco. This association has a quartz mill on the way, which is to be erected on the Colorado river, nine miles from the mine.

The Leland Company are running a bed-rock tunnel, and are now in 100 feet. ... The

Mitchell is about to have some of its croppings crushed. ... In the Intaba and Sacramento districts prospects are encouraging. ... Mr. George E. Willett, who is working the Techatieup mine in El Dorado Canon, informs me that he has erected a large quartz mill and other buildings, is putting in new engines and batteries, and making every preparation for crushing."

IDAHO.

The *Avalanche* says: Very rich ledges are reported to have been found recently near Quick-silver district, about eight miles distant and southeast of here. The Andy Johnson and Mayflower are more particularly noted. The latter is reported to be seven feet wide, and we have before us a certificate of an assay of the rock made by Chas. P. Robbins, which shows, silver, \$636.53, and gold \$1,255.81—total per ton, \$1,892.34. Other assays ranging from \$500 and upwards have been made.

MONTANA.

The *Post* of June 16th, says: Mr. J. Despeck, who has just come over from Helena, informs us that \$18,000 were washed from the claim of Judson & Metcalf, on Montana Bar, Confederate Gulch, in seven days, and that he saw \$4,000 carried away in a bucket from Smith & Barchett's claim, after a run of ten hours. ... We learn that mining at Wisconsin Gulch is progressing very favorably. The average pay was about \$25 to the hand. ... As the Fosters were sluicing down to the bed-rock, cleaning off the foundation for their mill at Summit, on the Mesler lode, they came across the blue clay seams which always indicate the proximity to a lode in this district; and pursuing their investigations, they found a fine ledge, three feet and six inches in width, and panning out well.

A correspondent of the same paper says: Speaking of quartz, we may mention that Col. Keyser has recently had ten assays made on the New York Extension of the Big, or Croesus, or Cliff lead, as you choose to call it—five of the assays averaging \$28, and five \$76 to the ton. ... Lettuce and radishes are in the market. We give this information for the benefit of those who think that Montana is a region of eternal winter. ... Steamer Big Horn, 71 days from St. Louis, had arrived at Fort Benton.

Letter to same, from New York Gulch, says: A number of claims on this bar are being worked, and will average about three hundred dollars per day to the hand. In Uncle Jonnie's Gulch about fifteen hundred feet of the lower end will average about twenty five dollars per hand. I have also had occasion to visit the bars below the mountains, on Magpie Gulch, which empties into the Missouri, just above the Canon Ferry. These bars are very extensive, and lie on each side of the gulch. They are from two to twelve feet deep and upwards. Some gold is found all through the gravel, which latter lies within a foot or two of the surface, and prospects, I am told by reliable miners, from one cent to ten cents to the pan. I saw some of the gold: it has a beautiful color, and is well washed. Several similar bars are being worked on Cave Gulch, about half a mile down the ravine, and with a small head of water yield twenty-five dollars per day to the hand. Up above the canon in Cave Gulch we understand the claims are turning out very well; the diggings are shallow and rich, but owing to the small amount of water, not half of the claims are being developed. The first dry gulch below Cave, known here by the name of Cooper's Gulch, is very rich, especially in its bars; \$5 and \$6.25 have been taken out, and all the gravel, which is about six feet deep, prospects largely. But no water can be had, and the distance to haul it is so great to make it profitable—at least it is so thought. In the drain ditch in Kingsberry Gulch, yesterday, they took out \$2.50 to the pan, with a beautiful wash. They work and wait patiently, but do not want to sell. ... They have just struck from five to twelve dollars to the pan in Boulder, below Diamond, on Nos. 5 and 6, below discovery. Judging from appearances, the gulches on the right bank of the Missouri river are just being opened, and will not, in the main, get in good working order before next season. ... Boulder is just drained, and opens remarkably well. If it "continues in well-doing," the prospects are bright. ... Confederate has but one drain ditch to the bed-rock, and is not prospected from rim to rim. ... White's has two drains, but the gulch is not yet prospected. ... New York has not any ditch down yet, but they have struck rich gravel, and are in hopes of soon reaching bed rock, and a streak of luck. ... Kingsberry is just sounded, and the ring is of the pure metal.

COLORADO.

The *Journal* of June 12th, has these items: Coming over through Clear Creek county yesterday we noticed that Mr. Sabin had started the Bullion company's mill. Also that Mr. McIntyre had commenced trying his super-heated steam experiment or enterprise. ... The Downville mill is running and good results are confidently anticipated from it. ... A new

mill is building just below Mill City. The Bertola men are hoping much just now from the use of the sodium amalgam in connection with the Bertola process. ... At Empire, Mr. Peck started mining last week, running 180 feet of water from his shaft in three or four days. ... At Argentine, mining has begun, notwithstanding the rough weather, on the very crest of the ridge. ... At Georgetown, too, several parties are commencing and prosecuting mining enterprise. ... Sixty has his springs at Ilhilo at last ready for use. Altogether the prospects of the county are considered by old residents brighter than ever before.

From the *Denver News* of June 13th, we clip the following: The mining season is opening with more promise in Colorado than for at least three years past. Particularly is this the case in the gulch, bar and placer diggings. More gold will be taken from the washing in Park, Summit and Lake counties during 1866 than in any preceding year. Dealers in merchandise tell us that their sales of gum boots and other similar articles for miners' wear, are larger than in any spring since '63. That year a very large portion of their sales were to Montana and Idaho adventurers. This year their sales are confined to the wants of Colorado. Lead mining will also be pushed more actively than for years past. ... The assays from nine different lodes in Red Mountain, belonging to the Union company, yielded an average of one hundred and twenty-five dollars per ton, the lowest assay being \$112 per ton. We are also creditably informed that a lode near the Twin Lakes, the location of which can be seen on the photographs of Twin Lakes, yields nearly \$1,000 per ton, about half silver. Assays from twenty Red Mountain lodes, made last fall by Behr & Keith, of Central City, yielded an average of over \$100 per ton.

From the *Register* we glean the following: Shipments of gold for the past week do not "pan out" as largely as usual on account of the difficulty of mining in consequence of the great annoyance of surface water. The heavy snow and rain storms of two or three weeks past, have created an unusual amount of water in several mines, and caused suspension of all work except pumping. The Narragansett company reports 81 ounces; John Sensenderfer, 83; The Gunnell Co. 142; the Black Hawk Co. 191; the Briggs Co. 143; Warren, Hussey & Co., about 50; Konitz Bros. 72; and Geo. T. Clark & Co. a small lot of about 15 ounces, making in all 777 ounces.

There was considerable excitement in regard to reported new discoveries on Bear River.

The *Journal* quotes the following from the *Stockholder* of May 22d: "Professor Hill, of Providence, R. I., has just returned from Europe, where he has been visiting the works for the reduction of ores. It is probably in pursuance of his suggestions that one of the great smelting firms at Swansea in Wales, which keeps in operation 150 furnaces, have sent out their agents (expected by steamer now due), to conduct investigations with a view to the establishment of smelting works in Colorado. It is found, remarkable as the result may appear, that from ores worked in Colorado with a gross yield of only \$10 per ton, the amount of \$500 per ton has been realized in the treatment at Swansea."

OREGON.

A clean-up of fifteen tons of White Bull rock at Quartzville yielded \$3,000.

The *Dalles Mountaineer* of June 15th says: The mines about Canyon City continue to pay well, particularly those of Olive Creek. Several rich strikes have been made, and the people of that locality think that Olive is the mining camp of this upper country. ... From persons who recently arrived from the John Day country we learn that there is a great scarcity of men in those mines. ... The recent rich discoveries on Olive Creek and the waters of the John Day, have nearly depopulated other camps in that district. The ruling rates for laborers is \$5 and \$6 per day. ... A quartz mill has been ordered for the Middle Fork District.

BRITISH COLUMBIA.

A private letter from William's Creek, Cariboo, says that times were never so brisk there, or money so plentiful. Canyon Creek is also spoken of highly.

The mining near Big Bend is favorable. ... Above the Canyon three companies are taking out \$20 per day on the surface, to the man, with rockers. ... About five miles above French Creek snow is three feet deep. The mining companies on the creek are making preparations for work. The Munroe company are taking out about one thousand dollars per day.

THE PULSE.—The pulse of healthy males beats eighty-one times per minute while they are standing, seventy-one times while sitting, and sixty-six times while lying down. That of a healthy female beats ninety-one times per minute while standing, eighty-four times while sitting, and seventy-nine times lying down. Any muscular activity in either of these positions will, of course, greatly increase the rapidity of the beats.

Trades and Manufactures.

WM. BARTLING. HENRY KIMBALL.
BARTLING & KIMBALL,
BOOK BINDERS,

STONEWARE AND EARTHENWARE OF ALL DESCRIP-
tions, such as Butter Pans, Pickle Jars, Churns, Water
Jugs, Bean Pots, Flower Pots, etc., etc., from the manufac-
tory of N. Clark, Esq., Sacramento—constantly on hand
and for sale, in quantities to suit, by
J. M. PAGE,
20v12-3m No. 42 Clay street, between Drumm and East.

FIRE, HYDRAULIC & SUCTION HOSE,

And Leather Belting.

M. M. COOK & SON,

81 Battery Street, San Francisco.

Are now manufacturing as above, Fire, Hydraulic and
Suction Hose, and Leather Belting, of any dimension and
in any quantity which may be desired. Fire Hose and
Belting constantly on hand or manufactured to order. Also
Saddles and Horse Collars.
The subscribers would respectfully ask purchasers to call
and examine their stock—also testimonials of the efficiency
of their work from such as have used their hose both for fire
and mining purposes. A diploma was awarded to us last
year, by the Mechanics' Institute, of this city, and a silver
medal this year. 12v11-1y

ENGRAVING AND ELECTROTYPING

THE PROPRIETORS OF THE MIN-
ING AND SCIENTIFIC PRESS, having
now in their office one of the best
draughtsmen in the United States, are prepared to furnish
Wood Engravings, for illustrating all kinds of machinery,
buildings, mines, trade marks, etc., in a superior and artistic
manner. We shall give our customers in this line
satisfactory work, and reasonable prices. Orders for stereo-
typing and electrotyping promptly filled.

San Francisco:

Saturday Morning, July 7, 1866.

NEW VOLUME.

This issue commences the *Thirteenth Volume* of the MINING AND SCIENTIFIC PRESS. The third volume has just been completed since the first enlargement of the paper by its present proprietors, in January, 1864.

Our endeavors to improve the journal and keep pace with the advancing wants of the times, have been duly appreciated by an increased patronage. This, with other and more stimulating (but perhaps not more essential) encouragement, warrants us in promising a still better paper for the future. To our correspondents, our subscribers, and brethren of the press, who have assisted and encouraged us in our efforts, we return our kind acknowledgments.

Magic Photographs—How Produced.

Magic photographs, which are now among the most recent of our scientific toys, are of various kinds. The first and most common mode of producing them consists in placing an apparently common piece of blotting paper upon an apparently plain piece of white albumenized paper, moistening the two and producing at once a photographic picture. The explanation of this is simple, and is doubtless familiar to old photographic experimentalists. It consists in bleaching, until it is white and invisible, by means of bichloride of mercury, a silver print; then taking a piece of blotting paper which has been previously immersed in a solution of hyposulphite of soda, and placing it in contact with the immersed print; this, when moistened, at once darkens the bleached image, and a picture, consisting chiefly of sulphide of mercury, is produced. A still prettier application of parlor magic is accomplished by placing an apparently blank piece of paper into a solution—the material for which is inclosed in the packet—a beautiful blue print is produced. This is doubtless the result of one of the applications of the Cyanotype process of Sir J. Herschell, which may be made to produce many beautiful transformations. The *British Journal of Photography* gives the following method of producing the "magic photograph":

Print a picture on albumenized paper in the usual way, taking care not to print so deeply as ordinarily. Fix the print (without toning) in plain hyposulphite of soda, wash thoroughly, and then immerse it in a saturated solution of bichloride of mercury till the image disappears. Again wash thoroughly and dry. The paper now appears like a piece of plain albumenized paper, without any appearance of a picture on it, and in this condition it may be kept for an indefinite time.

To cause the image to appear instantaneously and in more than its pristine vigor, dip the paper in a weak solution of hyposulphite of soda; or, preferably, dip a piece of white blotting paper in a solution of hyposulphite of soda and dry it. This prepared paper may be kept in contact with the latent picture so long as moisture is excluded. When it is required to develop the image, moisten the blotting paper with common water and press it against the albumenized surface of the print, when, presto! the "magic photograph" is produced, and is, when well washed, as permanent as many of the photographs of the present day. The image, by being again immersed in the bichloride of mercury solution, may be once more rendered invisible, and by the hyposulphite solution again restored as often as may be desired.

The amusement that can thus be introduced into the social circle by the "magic photograph" may be easily conceived.

CORBETT'S ROASTING FURNACE.

In our issue of April 7th, we copied an article from the *Reese River Reveille*, giving a brief description of a newly devised apparatus for roasting sulphurets. We yesterday received a call from Mr. Corbett, the inventor, who submitted to our inspection diagrams of the apparatus and a working model, which has been in operation about one month at Austin, two weeks of which time it was constantly at work.

The apparatus may be described substantially as follows: First, a cylindrical shaped hearth of brick is constructed, with a furnace arranged as in the ordinary manner of a reverberatory furnace. Through this furnace longitudinally, passes a hollow rock shaft, with two sets of hollow arms supporting two paddles or shovels, much as the floats of a steamboat wheel are secured. The shaft, arms and floats or shovels are all hollow, steam tight and in communication the one with the other. The floats are placed in a position diagonal to the shaft with a curved face, instead of being in a line with the shaft, as in the steamboat wheel, the object of which arrangement will soon appear. The ore is placed in the cylinder to the depth of twelve inches, more or less. A charge for a furnace twelve feet long and eight in diameter, is about four tons. The shaft is made to rock back and forth, by which the floats or shovels are made to thoroughly stir the entire mass and lift up the lower portion of it at each forward movement, raise it to near the top of the cylinder, and thence drop it gradually through the flame and air current, which is kept constantly passing through the cylinder.

To protect the iron of the shaft and stirrers, a stream of cold water is made to pass in at one extremity of the shaft, alternately filling and being emptied from the arms and shovels, while the steam generated is caused to pass out through a proper aperture at the opposite extremity, from whence it is conveyed to a steam drum upon the top of the furnace or to a boiler conveniently placed for receiving it, and from whence it can be applied to driving an engine. It is claimed that the constant influx of cold water will keep the iron at a temperature sufficiently low to prevent any very rapid action of the sulphurous gas upon the same.

The discharge, which is self-acting, is made from a proper opening near the bottom of the hearth, which can be opened and closed while the machinery is in motion, and is so arranged that a jet of water can be applied in such a manner as to prevent any dust from rising. The roasted ores are received into an iron car, in which they are conveyed directly to the amalgamators.

Mr. Corbett's plan seems worthy of the earnest attention of all concerned in milling and mining. He has shown us testimonials from a large number of millmen and superintendents about Austin, who express themselves highly pleased with the action of the model which he constructed and operated there. He claims for his invention efficiency and economy, and that while it possesses these qualities its cost will not be as much as those of the ordinary construction, from the fact that, according to his calculation, it will require from five to eight ordinary furnaces to do the work which he expects one of his will accomplish.

With his furnace, and the labor of three men and the consumption of three cords of wood, he expects to desulphurize twelve tons of sulphurets per day, at a cost of \$42—Reese River prices. The cost of desulphurizing that amount of ore at Austin, by the furnaces now in use, is about \$136.

To this saving must be added any benefit which can be obtained from the use of the steam generated. This he also claims will be very considerable; as the boiler can be set directly over his hearth and made to form the crown of the same, while it is at the same time receiving the steam from the stirrers as fast as generated there. Of course the water has to be pumped into the rock shaft axle, the same as into a boiler.

The stirrers will be made of cast iron, and can be replaced as often as necessary, for a cost of about \$200; which will be but little more than the cost of scrapers by the present process. Mr. Corbett can be seen every day, from 9 till 12 A. M., at Mr. Linforth's office, corner of Front and Market streets; where he will be happy to exhibit his diagrams and the model which he has had in operation at Austin.

New California Patents.

List of Patents, with claims attached, which have recently been issued to inventors on the Pacific Coast; most of which were taken out through the MINING AND SCIENTIFIC PRESS PATENT AGENCY:

DRILL FOR ARTESIAN WELLS.—Henry Palmer, San Francisco, Cal.: I claim a double-edged drill, cutting at the upward, as well as at the downward stroke, or blow, with beveled shoulders, or upward cutters inclining equally upon the adjacent planes, and at right angles with the stem, substantially as and for the purposes specified and set forth.

NEWSPAPER FILE.—J. W. Foard, San Francisco, Cal.: I claim the short recess at the bottom of the file, in combination with the movable nut whereby the hinge is operated, the latter enabling one to adjust the file at that end to any desired thickness of paper.

PROCESS IN REFINING SULPHUR.—Robert Oxland, San Francisco Cal.: I claim the use of chemical agents in the manner hereinbefore described, either in substitution of the ordinary process of sublimation for refining sulphur as supplementary thereto, for the completion of the refining operation.

APPARATUS FOR RAISING WATER BY WAVES.—A. N. Shattuck, San Francisco, Cal.: I claim the buoy pump made to act by the agitation of the water, substantially as above described, consisting of a floating vessel, A, its tube, B, combined with a fixed tube, C, both tubes being provided with check valves, and the floating vessel, A, being guided in any suitable frame, as above set forth.

CAGE FOR HOISTING PURPOSES IN MINES.—Henry Berry, Hugo Hochholzer and Frank Denver, Virginia City, Nevada: First, We claim the adjustable arms, A, A, india-rubber springs, K, K, or their equivalents, together with the head-piece, B, pillow, E, and beveled shoulders, L, L, in combination with the large arms, F, F, and guides, G, G, substantially as described for the purposes set forth.

Second, We claim the cap, C, C, hung on hinges in combination with the braces, c, c', and head piece, B, substantially as described and for the purposes set forth.

MACHINERY FOR SEPARATING METALS FROM ORES.—John A. Hitchings, Denver City, Colorado: I claim, First, The arrangement of the mortars, rounded stumps, and slotted connecting openings, substantially as and for the purposes set forth.

Second, The arrangement as a sequence to the subject matter of the first claim, of the rollers, N, in the trough for the further comminution of the ore received from the stamps.

Third, A basin-shaped revolving roasting plate, Fig. 4, provided with scrapers as described, and with a vessel containing salts of soda, allum or potash, which are intermingled with the ground ore.

Fourth, The arrangement, with the revolving roaster, of the cold water tank which receives the heated ore therefrom, as described.

Fifth, The arrangement of the roasting plate, cold water bath, amalgamator, and arastra, as described.

Sixth, The quicksilver-coated copper amalgamator, acting as a final means of arresting non-mercurialized metals, arranged and operated as described.

Seventh, The condenser arranged as described, consisting of the flue, Z, passing through the water chamber, the discharge pipe, h, and the chamber, b, the shower bath, c, and exit flue, f.

Plow.—John Mott, Danville, Cal.: I claim, First, As a new invention, the use of a double plow revolving upon a horizontal axis, L, the two plows being placed one over the other in an inverted position, substantially as described and for the purpose set forth.

Second, I claim the claps, M and N, for hinging the main rod, L, to the standards, C and I, and the adjustment with washers, or their equivalents, of the claps, N, for turning the plow more or less to land, substantially as described.

Third, I claim the set-screws, s, s', placed in the upper end of the standard of the plows for steadying them and keeping off the land side from the standard, J', substantially as described.

ANIMAL TRAP.—A. A. Fradenburg, Nevada City, Cal.: I claim, in traps for vermin, the combination of the grating, D, on the platform, P, with the revolving door, E, the stops, N and F, substantially as shown.

APPARATUS FOR LOWERING SHIPS' BOAT.—Samuel Brown and Leon Level, San Francisco, Cal.: We claim a breaking block for running out even lengths of two or more ropes having an extra set of sheaves, c, which are capable of being moved to and from the real sheaves, a, by a breaking lever, F, the different sets, a, c, of sheaves being secured rigidly to their pins, b, d, substantially in the manner and for the purpose set forth.

METHOD OF BLASTING.—Nirum Cadwallader, Birchville, Cal.: I claim the use of compressed air in combination with all explosive substances, for the purpose of increasing the

explosive force of said substance by the aid of a greater amount of oxygen, and assisting by the force of pressure, as well as by the expansion of the air from the heat generated by the explosion, said compressed air to be confined in a chamber or recess contiguous to it, to be let free at the time the explosion takes place, substantially as described and for the purpose set forth.

COIN HOLDER.—Norbert Landry, San Francisco, Cal.: I claim the arrangement of coins and medals upon a vertical inclined or horizontal axis, between or upon transparent substances, to be revolved, at pleasure, for the purpose of displaying said coins or medals, substantially as herein described and set forth.

SWIVEL SHACKLE.—Thomas B. Roach, Folsom, Cal.: I claim the swivel shackle, constructed substantially as herein described.

LIST OF OFFICERS OF CORPORATIONS AND MINING COMPANIES.

[PUBLISHED IN THE FIRST ISSUE OF EACH MONTH.]

[Below we give the date of recent meetings held in this city, and the names of officers chosen or appointed. Every bona-fide company is invited to send us the result of their election, to be thus put on record, gratuitously, with any other facts of general interest.]

IMPERIAL S. M. Co.—June 26th. Trustees: John Sime, W. B. Bourn, F. P. McMahon, John Barton, Wm. H. Gawley, H. F. Cutler, J. E. de la Montagne. President, Wm. B. Bourn; Vice President, J. E. de la Montagne; Secretary, D. A. Jennings; Superintendent, P. S. Buckminster.

LADY OF THE LAKE G. & S. M. Co.—July 2. Trustees: R. J. Trumbull, S. W. Dennis, W. Hollis. President, R. J. Trumbull; Secretary and Treasurer, Wm. Hollis; Superintendent, Alonzo Young.

LELAND G. & S. M. Co.—July 2d. Trustees: R. J. Trumbull, S. W. Dennis, Wm. Hollis. President, R. J. Trumbull; Secretary and Treasurer, Wm. Hollis; Superintendent, Alonzo Young.

MINA RICA DE LAS FLORES M. & M. Co.—June 9th. Trustees: Mullot sine, L. Pouzadonx, B. Pasquale, J. Merle, L. Blanchard, A. Enqvist, C. Gailhard. President, Mullot sine; Secretary, S. Dickinson; Treasurer, A. Borel; Superintendent, A. Bonglival.

MORNING STAR G. & S. M. Co.—June 20th. Trustees: D. S. Shute, S. A. Winall, O. Dickinson, Jr., N. C. Efford, A. G. Soule, H. J. McMurray, F. M. Conro. President, F. M. Conro; Secretary, Chas. S. Capp; Treasurer, S. A. Winall; Superintendent, J. C. Ransom.

PACIFIC G. & S. M. Co.—May 21st. Trustees: A. P. Stanford, E. J. Sawyer, D. B. Arrowsmith, H. R. Reed, L. B. Lott. President, A. P. Stanford; Secretary and Treasurer, H. R. Reed.

SALAMANDER G. & S. M. Co.—May 21st. Trustees: E. L. Roesing, Wm. Jackson, Dr. O. P. Warren, John Speckmann, Jas. McComb, G. W. Smith, and F. D. Gallagher. President, G. W. Smith; Secretary, E. J. Pfeiffer; Treasurer, Wm. Jackson.

SISKIYOU M. Co.—March 12th. Trustees: Jas. T. McDougall, Elander Heath, Richard Strothoff, Albert Farrar, Wm. Nagel. President, Elander Heath; Secretary, E. J. Pfeiffer; Treasurer, Henry Pledge.

SOSHONE S. M. Co.—June 13th. Trustees: Henry Carlton, Jr., Henry W. Cleaveland, J. W. A. Gilnor, Stephen R. Harris, David Wilder. President, Henry Carlton, Jr.; Secretary, David Wilder; Superintendent, M. J. Goodyear.

RECENT INCORPORATIONS.

ANTIOCH PREMIUM PET. Co.—Contra Costa Co. Capital stock, \$1,600; 400 shares; \$4 per share. Trustees—C. J. Dempster, Benj. B. Grove, Geo. W. Brown, Fred. Wilkening, T. O. Carter. June 22.

CAL. MEDICAL ASSOCIATION.—Capital Stock, \$20,000; 80 shares; 250 per share. Trustees: Edward Cohen, E. Parsons Fish, and J. Alvin Cook. June 16.

FORTY ASSOCIATES HOMESTEAD ASSOCIATION. Capital stock, \$12,000; 40 shares; \$300 per share. Trustees: John W. Farren, Edward Barry, D. A. McDonald, Thos. J. Dixon, Geo. McDonald, Wm. Sulton, Allen H. Bewley, Thomas Pollard, Wm. Hollis. June 18.

JOICE PETROLEUM OIL Co.—Bolinas, Marin county. Capital stock, \$120,000; 1,200 shares; \$100 per share. Trustees—Geo. Hearst, R. P. Hammond, Wm. T. Daly. June 8.

MERCHANTS' EXCHANGE ASSOCIATION OF S. F. Capital stock, \$250,000; 2,500 shares; \$100 each. Trustees: Thomas H. Selby, Louis McLane, Richard G. Sneath, Alvinzo Hayward, J. W. Stow, David Stern, and J. B. Cavalier. June 1.

VERITAS G. & S. M. Co.—Nevada county. Capital stock, \$600,000. Trustees: Alex. Gamble, S. C. Bowley, Geo. Wallace. June 13.

Hungerford's Improved Concentrator, for Saving Gold, Sulphurets, Quicksilver, Etc.

Fig. 2.

There is no description of machinery of so much importance to the mining interest of California, at the present time, as that for the separation of sulphurets. Mines are now abandoned, or, what is worse, paying assessments which, if the sulphurets were saved, would yield handsome dividends. Great difficulty, owing to the varied form and character of the sulphurets, has been experienced in devising a machine to separate them, and it is only by close and patient observation, persevering study and careful experiment, that any machine can be made or matured so as to save a high percentage of the sulphurets which are in the ore. No machine is so perfect as to save all; and the best is that which will save most with the least expenditure of time, money and power. Many machines have been tried, and many abandoned; all of which have been unable, so far, to attain a profitable separation, and meet the requirement of the mining interest, so well as that now patented by Mr. Hungerford, which is an improvement on the well-known Hungerford & Prater Concentrator, with which his name is already so familiar.

The separating or concentrating action is obtained by centrifugal force and gravitation; the pulp being preserved by water in the proper condition for the operation, and the pan so constructed, mechanically, as to allow the centrifugal force and gravity to expend themselves to the best advantage in producing the separation, as well as to make the machine simple, compact and easily kept in order.

Fig. No. 1 is a perspective view of the Concentrator while in operation, showing the general arrangement. Fig. No. 2 is a section through the centre of the pan, showing how it operates in separating the sulphurets, as well as the great improvement to the pan, which consists of the addition of a circular trough outside the periphery.

Its operation is as follows: The pulp flows from the spout through the filler into the bowl at the top, from which it is distributed equally over the convex cover into the pan near its outer edge. The lightest sand is at once carried off with the overflowing water through the centre opening, and the sulphurets are allowed, from the motion given to the machine, to gravitate to the bottom toward the outer edge, forming an embankment all around the pan, as represented at I, I, Fig. 2. The lighter particles of the sand arranging themselves on the top, at 2, 2, Fig. 2, from which they are being constantly washed away with the water flowing through the central opening. The sulphurets are, by the centrifugal motion of the machine, made to pass through small openings at the bottom, at intervals of a few inches around the circumference, through the inner wall of the pan to the circular trough 3, 3, Fig. 2, where they come in contact with the mercury at the bottom,

depositing the free metal, from which it is drawn at pleasure by an opening in the bottom, and the sulphurets, in the order of their density, by openings in the sides.

It will be observed that the sulphurets in the trough, 3, 3, are maintained at the same elevation as the sulphurets and overlying sand in the body of the pan. It will be further observed, that by no possible means can the sand in the latter pass to the former in such quantities as to form any considerable percentage of the amount saved. The advantages of this improved pan are continuous action, requiring no attention except to remove the receiving vessels as fast as they are filled from the openings shown on the right of Fig. 2, simplicity in construction, and durability and cheapness of cost.

The pan derives its motion from two eccentrics secured on a horizontal shaft passing across and below the centre of the pan and working between two pair of adjustable wooden guide blocks or hearings. The eccentrics are so made as to hear equally on the wooden guide blocks in all positions while in motion; giving to the pan the most desirable motion for its purpose, and doing away with all complexity of rods, cranks, wooden frame, etc.

Recommendations.

"Tell Mr. Hungerford that his machine is worth its weight in gold. I have proved, by actual test, that it will pay for itself every five days, running on the Vulture rock. I found that it yielded nearly \$1,000, out of 120 tons, and then it was forced beyond its actual capacity. There is no doubt about its utility, and every quartz mill operator in this section, and all other quartz-mining localities, will find them an absolute necessity."

J. TYSON.

"Dated Wickenburg, Cal., January 2, 1866."

"SONORA, September 24, 1864.

"We have been using one of Prater's Concentrators, at our mill, with the most signal success, for some months past. The yield of the rock at our mill is about \$45 per ton, while rock from the same ledge crushed at other mills not using this Concentrator, is yielding but \$25. The sands from the batteries in our mill are received from the stamps direct into the Concentrator, which effectually separates all the gold, amalgam, and sulphurets from the rock, with the above results."

"WHEELER & THAYER."

It should be borne in mind that Mr. Hungerford is the original builder and maker of the celebrated Prater Concentrator, and his name should be sufficient guarantee to warrant the public in examining his new machine before purchasing elsewhere.

M. HUNGERFORD,
MINERS' FOUNDRY, FIRST STREET.

Those interested in mining, and who call at the Miners' Foundry to see the one which is there in operation, will have no reason to regret their visit.

SAN FRANCISCO, June, 1866.

THE GOLDEN STATE IRON WORKS.—Messrs. Palmer, Knox & Co., proprietors of this foundry, have just issued their "Pattern List and Hand Book," a really handsome and valuable work for miners and millmen. Their list shows an extensive and varied assortment of patterns. The book is intended for gratuitous circulation among the friends and patrons of the publishers. It forms a very liberal offering. Printed at the Mining and Scientific Press Book and Job Office.

Rheumatism !!

READ IT! READ IT!!

H. BOWMAN—DEAR SIR: THIS IS THE FIRST WRITING I have done in two years, and it affords me great pleasure to be able to use my pen in the service of those who are suffering, as I have suffered, by stating the following facts:

I have for two years and upwards been afflicted with CHRONIC RHEUMATISM, and until a few weeks ago I have never found anything that afforded me any relief. For three months of the time I was unable to feed myself, and for the last five months my arms have been so bent that I have not been able to dress myself. I was five months at the Warm Springs, at San Luis Obispo, and three months at a Hydropathic Institute in Stockton, and I have been under the care of six different physicians, in the vain hope of relief. About four weeks ago I was induced by a person who had been cured by it to try a bottle of RICHARD'S REMEDY FOR RHEUMATISM, and in less than twelve hours I experienced great relief. In a few days I was enabled to straighten out my arms, and I have been getting better and gaining in strength and flesh ever since. I have now the complete use of all my limbs, and, for the first time in two years, I am out of pain. I do feel for those who suffer as I have suffered, and if they will take my advice, they will lose no time in giving the REMEDY a trial. Yours truly,

GEORGE TAYLOR.

RICHARD'S REMEDY is for sale by

H. BOWMAN,

Druggist, Sacramento.

Price, \$2 50 per Bottle.

Occidental Homestead
ASSOCIATION,

Office, 305 Montgomery street, San Francisco.

Capital Stock : : : : : \$33,600

102 Shares, \$33 Each.

THIS ASSOCIATION was formed to enable its members to obtain desirable homestead lots in this city, at a cheap and easy rate, paying for the same by regular monthly installments. For this purpose they have purchased blocks 499, 500, and 601 in the Western Addition to this city, bounded by Devisadero, Pine, Broderick and Clay streets. Subscribers will pay an initiation fee of \$5 on each share taken, to form a fund for defraying current expenses, and \$11 per month for thirty months, commencing in April, 1866. The property is within three blocks of the Turk Street Railroad, is nearly all on the grade, and is most desirably located for homestead purposes. It is directly east from the lands of the California Homestead Association. The property has been purchased on very reasonable terms, and offers a rare opportunity for investment. A number of fine houses are in process of erection, and streets are being graded near this property, which will greatly increase its value.

When twelve monthly payments have been made, the property will be divided among the members in the usual manner, and each shareholder will receive a contract for a deed to the lot or lots to which he may be entitled, and have the privilege of taking immediate possession of the same. The lots average 27 feet in front by 120 feet in depth. The whole amount due upon any lot may be paid at any time, and discount at the rate of 1½ per cent. per month will be deducted therefrom. Persons wishing to visit the lands of this Association will take the Turk Street cars to Devisadero street, and thence go northerly along Devisadero to Pine street.

\$20,000 of the capital stock is taken, and the hooks are open for subscription to the balance, at the office of the Secretary, where the Official Map of the Association can be seen, and all particulars obtained. The Title to this property is perfect.

J. S. LUTY, Secretary.

Office 305 Montgomery street, corner of Pine, Rooms 2 and 6. 20v12-tf

AN ENGINEER of Toulon has invented a plan for keeping the water in the harbors of the Mediterranean, which is in a perpetual state of stagnation in consequence of the absence of tides, constantly renewed by an ingenious mechanical apparatus. The naval prefect of Toulon, who distinguished himself so much while the cholera was prevalent in that town, is about to test this invention. If the trials prove successful, the discovery will be most valuable from a sanitary point of view, as the unhealthiness of many of the ports is chiefly caused by the stagnant water.

A GERMAN has succeeded in counting the hairs of four women's heads, of different complexions. The blonde had 140,419; the brown-haired had 109,440; the black-haired, 102,962; and the red-haired, 83,740.

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW
prepared at the shortest notice and at the most reasonable rates, to furnish all
kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps
of all kinds, Hoisting Gear, Gas Works, Laundry Machinery, Architectural and Ornamental
Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag,
Screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all
kinds of Castings.
ENGINES.—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats,
Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six
to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in
use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam
Pump and Fire Engine.
BOILERS.—Locomotive, Fine, Tubular, Upright, Cylinder and Cornish, and every
variety of Boiler Work. All sizes of tubes and pipes for pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's Improved Tractory
Curvo Pan, Zenas Wheeler's Improved flat bottom pan, Beldin's pan, Veatch's tubs,
Prater's concentrators, Wallace's pans, Beers' pan, Oeyman Barrels, Astra Gearing, Chile
Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for silver and Gold,
Portable Stamp Mills, Straight Batteries, for wood or Iron frames, Dry Crushing Bat-
teries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams,
Pans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS,** of all sizes.
OIL BORING TOOLS AND MACHINERY.—Of the latest and most ap-
proved construction, made from drawings lately made by Prof. Blake at the oil wells in
Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to
test their value, by the hundred weight or ton.
Ruslin Iron Screens, of all degrees of fineness and of all qualities of Iron. All work done
in the best manner at the lowest cash prices.

The New River (Trinity County) Mines.

As considerable interest is beginning to be manifested in connection with this extensive but little known mining district, we have deemed it proper to furnish all the information at hand in relation to it, hoping and believing that the time is not far distant when it will be filled with an industrious and prosperous population.

New River heads in the range of mountains dividing Trinity and Klamath counties, and is about thirty miles in length. The river at the Forks, eighteen miles from its junction with the Trinity, is as large as the North Fork, and at no season of the year contains less than a hundred sluice heads of water. The following list of distances to the mines of that section from the points indicated, are obtained from parties who have traveled the several routes mentioned, and who are familiar with the country. From Weaverville to North Fork, the distance is fourteen miles; North Fork to Scheffer's store, two miles from the mouth of Rattlesnake creek, twenty-four miles; Scheffer's store to Lake City, on the North Fork of New River, sixteen miles, making the total distance from Weaverville to the diggings, fifty-four miles. To reach them from Humboldt Bay the distance is about 100 miles, as follows: Arcata to Fort Gaston, forty-two miles; Fort Gaston to mouth of New River, twenty-eight miles; mouth of river to Caraway & Garratt's trading-post, eighteen miles, thence to Lake City, twelve miles. Virgin Creek, the principal tributary from the south, is reached six miles from the trading post in question, and along its banks some of the richest claims ever found in the county have been worked. The upper settlement on the river can be reached from the South Fork of Salmon river in half a day's travel.

But little was known of the New River country until the year 1860. During that and the following year from one to two hundred miners worked in the banks and bars along the stream, but in no single instance, that we can learn, extending their researches to the flats and hills where water could not be conveniently obtained. As in the early days of California, when men, not content with an ounce or \$20 a day must hunt for better digging, so it was on New River then. Most of the miners had made money, and the fabulous reports from the Salmon river of the North were enticing. Some sold their claims for a mere song, while others deserted them entirely, and started for the distant region where fortunes could be speedily harvested without any outlay of labor. That year also commenced the Indian troubles; the settlers were driven from their homes along the river, and the miners were cut off from their usual base of supplies. A few wintered on New River, and early in the spring of '63 the last remaining laborers were driven across the divide to Salmon river by the daky foe. For near two years—or until the close of the Indian campaign, the New River mines were entirely deserted. Last summer a few miners located near the Forks of the river, and at present there are some fifty or sixty white men and double that number of Chinamen employed, and we learn that new comers are arriving daily.

When we express the belief that one thousand miners can find remunerative employment along New River and its tributaries, we do it on the authority of practical miners' and reliable men, whom we have no reason to believe desire to misrepresent. That rich claims have been worked all along the stream for twenty-five miles, we know, and that there are thousands of acres of ground never yet disturbed by pick and shovel, we have good authority for asserting. As a general thing water is plenty the year round, the section is much easier of access than many others to which thousands of Californians are now madly rushing, and merchandise of all kinds is both plenty and cheap.

And not alone does the New River country offer flattering inducements to steady and enterprising men. The vast basin lying between the North Fork and New River, and bounded by the New River, Trinity and North Fork ranges of mountains, is but little known. Good prospects have lately been obtained near the head of French creek, which has its source in the New River range. The North Fork of Trinity is unprospected for twenty miles, and simply because the bars and banks are difficult of access. A party of enterprising men cut a trail from the summit of the divide to the bed of the stream, a distance of five or six miles, last summer, and opened a claim which paid well. Others will follow their example before long. On Grizzly Fork, a stream ten or twelve miles in length, only half-a-dozen men are working.

Along the lower Trinity important mining operations have been commenced the present year, and this condition of things will continue spite of much croaking to the contrary. We have John McCannion's word for it that Cedar Flat will send abroad a good report at no distant day. He has been here prospecting faithfully for the last three months, and has "struck it rich."

THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequalled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully Solicited.

Eyes! Eyes!! Eyes!!!

DR. HENLY, OCULIST AND AURIST, HAS
received from Scotland one of the most MIRACU-
LOUS REMEDIES for the benefit of the human eye,
ever before discovered. It is unparalleled in its
effect upon the diseases incident to this organ.
It gives wonderful power to the optic nerve, and removes
all the granulations from the lids, and all mucous film from
the sclerotic coat without the use of instruments. In fact,
it works like a charm on the eye, without giving any pain.
You feel the effect of the medicine in different parts of the
head. It drives the disease back into the system, which is
better able to stand it than this tender organ.
Why will you suffer when you can be cured in a few days.
Persons who have been blind for ten years have been re-
stored to their sight in a short time by the use of this medi-
cine. I will treat any person's eyes in the State, and if I do
not give them relief in a short time, I will not charge
them anything. Office, No. 751 CLAY STREET, opposite
the Plaza, San Francisco. 22v12

American and Foreign Patents.—Letters Patent
for inventors can be secured in the United States and foreign
countries through the MINING AND SCIENTIFIC PRESS PATENT
AGENCY. We offer applicants reasonable terms, and they
can rest assured of a strict compliance with all obligations,
and a faithful performance of all contracts. For reference,
we will furnish the names of numerous parties for whom
we have obtained patents during the past two years.

City College Laboratories,

Southeast Cor. Stockton and Geary sts.

Practical and Analytical Chemistry and Metallurgy.

THOMAS PRICE,
Professor of Chemistry.

(Formerly of the Normal College, Swansea.)

ANNUAL REPORT
—OF THE—
Pacific Insurance Company.

IN COMPLIANCE WITH THE ACT OF THE LEGISLATURE OF THE STATE OF CALIFORNIA, ENTITLED "AN ACT CONCERNING CORPORATIONS," PASSED APRIL 22, 1860, THE PACIFIC INSURANCE COMPANY OF SAN FRANCISCO MAKES THE FOLLOWING ANNUAL REPORT:

I.—The amount of the Capital Stock of this Company is SEVEN HUNDRED AND FIFTY THOUSAND DOLLARS, and paid in GOLD. \$750,000

II.—The amount of the Assets is ONE MILLION AND FIFTY-ONE THOUSAND, FOUR HUNDRED AND TWENTY DOLLARS AND THIRTY-SEVEN CENTS. \$1,051,420.37

III.—The Company has NO DEBTS.

IV.—The amount of insurance effected during the year, and which remained in force December 31, 1865: \$12,973,949

Fire. \$12,973,949

Marine. \$48,408

This Company commenced underwriting Marine Risks, August 1, 1865.

V.—This Company insures against the following risks, viz: BUILDINGS, HOUSEHOLD FURNITURE, MERCHANDISE, RENTS, LEASEHOLDS, VESSELS IN PORT AND THEIR CARGOES, and other PERSONAL PROPERTY, AGAINST LOSS BY FIRE.

Also, on CARGOES, TREASURES, COMMISSIONS, PROFITS, and WAR RISKS, and ON ALL MARINE AND INLAND NAVIGATION RISKS, TO AND FROM ALL PORTS IN THE WORLD.

VI.—This Company will take on any FIRST-CLASS RISK not to exceed \$75,000 (the limit fixed by law), and on all large risks will reinsure to an efficient company with PRUDENT in other RESPONSIBLE COMPANIES.

J. HUNT, President.

J. J. RALSTON, Secretary.

San Francisco, January 19, 1866.

On this nineteenth day of January, A. D. one thousand eight hundred and sixty-six, personally appeared before me, H. S. Homans, a Notary Public, in and for the said City and County, and therein being duly commissioned and sworn, A. J. Ralston, who, being duly sworn, did depose and say that he is the Secretary of the Pacific Insurance Company, and that the statements contained in the foregoing Report of the Pacific Insurance Company are true, full and correct.

A. J. RALSTON.

Sworn and subscribed to before me, this 19th day of January, A. D. 1866.

H. S. HOMANS, Notary Public.

6v123m

Capitalists, Attention!

QUARTZ MILL & MINING PROPERTY

FOR SALE

In Nevada County.

A NEW 8-STAMP QUARTZ MILL, 7 LEDGES AND 640 acres heavily-timbered Land, near Eureka, Nevada County, are now offered for sale. The Mill is run by steam-power, and is in complete order for business. The ledges, which form the principal value of this property, are all large and well-defined, but require a further outlay of capital, in order to make them remunerative. For the lack of means to properly develop these rich claims, the present owners are disposed to sell the same for a reasonable price. Capitalists wishing to engage in mining will find this a splendid opportunity to purchase a property that will bear great scrutiny, and offers superior inducements as an investment.

For address and further information, inquire of the Publishers of the MINING AND SCIENTIFIC PRESS, 505 Clay street, San Francisco.

SUBSCRIBERS who do not receive the MINING AND SCIENTIFIC PRESS in due time, are requested to inform the publishers.

A Rare Chance!

A Splendid Business in Alameda County.

FOR SALE AT A GREAT BARGAIN,

400 ACRES OF LAND,

INCLUDING

Landing, Wharf, Three Capacious

Warehouses,

Capable of holding 12,000 Tons, which amount of grain was stored and shipped the past year. Connected with said business there is an extensive Lumber Yard; sales during last year, two million feet, which sales, and the entire business, can be largely increased.

The above is a rare opportunity for parties desirous of engaging in an active business that will pay a large dividend on the investment. Satisfactory reasons given for selling, and all information desired can be obtained on application by mail, or otherwise, to

G. E. SMITH,

Notary Public and Searcher of Records, Office "Beatty House," San Leandro. 2v12-m

And in accordance with law and an order of the Board of Trustees, made on the tenth day of May, 1886, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Maurice Dore & Co., No. 327 Montgomery street, San Francisco, Cal., on Tuesday, the tenth of July, 1886, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

R. WEGENER, Secretary.

Office, 415 Montgomery street, San Francisco, Cal. j223

George Washington Gold and Silver Mining Company. Silver Mountain District, Alpine County, Cal.—Assessment No. 12.

Notice.—It is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 28th day of June, 1886, an assessment of one dollar and a half (\$1.50) per share was levied upon the capital stock of the said Company, payable immediately. In United States gold and silver coin, to the Secretary, at the office of the Company, only.

Any stock upon which said assessment shall remain unpaid on the 28th day of July, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 13th day of August, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

W. D. ROOT, Secretary.

Office, 338 Montgomery street, San Francisco.

Notice.—At the above meeting of the Board of Trustees, an order was passed making the undersigned General Agent and Attorney in Fact of the Company, with full power to take such steps as he may deem proper, to work the ores of the Company, and further develop the mine; and to that end may employ competent persons, lease or build mills, erect furnaces, enter into, make and let contracts, sign, seal and deliver obligations, and do and perform whatsoever thing else may deem for the interest of the Company at large, and with power to employ and substitute a Secretary during his absence.

W. D. ROOT, Secretary.

Hansom Copper Mining Company, Low Divide District, Del Norte County, Cal.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 29th day of May, 1886, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law, and an order of the Board of Trustees, made on the second day of May, 1898.			

THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Framework; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; a, Dies; c, Shoes; and o, Openings.

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan when properly constructed, are respectively 177, 118 and 132.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan one hundred and eighteen tons, and the Conical Pan one hundred and thirty-two tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes direct from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior." As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery, and the muller, which is curved, plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the **PACIFIC FOUNDRY,** 1st San Francisco.

SAVE YOUR MONEY AND BUY, For \$100!

HUNTER'S Premium Concentrator!!
Awarded a Silver Medal at the Mechanics' Fair of 1865.

THE ABOVE MACHINE HAS BEEN RECENTLY IMPROVED and simplified, doing away with all complication and friction, thereby requiring less power and speed. As improved, 125 revolutions per minute is the regular speed required, but any speed varying from 100 to 135 revolutions does not change the results. It is the only machine built on the Pacific coast that is perfectly adjustable for all the different grades of ores, and will save ten per cent. more sulphurets than any Concentrator in use, and is the cheapest, from the following list of prices:

For a single machine of the capacity of five tons in twenty-four hours, as it passes from the battery or pans, \$125. For double machines of two, three, or four tables in one frame, each table of five tons capacity, \$180.

I have been running machines for the past three months at Grass Valley, therefore I make my assertions from a practical working test, where several of the machines are working. Persons desirous of seeing the machines running, can do so at Empire Mill, Grass Valley, where twelve machines can be seen in operation, or in San Francisco, at 118 Washington street, below Davis, where ALBERT JACOBS will fill all their orders promptly.

ANDREW HUNTER,
Inventor.

IRON!

Glasgow Iron and Metal IMPORTING COMPANY,

Nos. 25 and 27 Fremont street, San Francisco.

Keep constantly on hand a large assortment of

(Known as HUNGERFORD & PRATER'S Concentrator.)

MANUFACTURED AT THE

San Francisco Foundry and Steam Engine Works.

Corner Fremont and Mission Streets.

All orders promptly attended to.

2v12 **DEVÉE, DINSMORE & CO.**

BAUX & GUIOD'S Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine Scientific Knowledge with Practical Experience, these pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgamators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by Baux & Guiod's Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the tritling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jeffersonian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada; City of Grass Valley, Nevada; Works, Nevada county; Waltham's Chlorination Works, Nevada; Cal.; Gold Hill Quartz Mill, Washoe; Manufactured at the Vulcan Iron Works and San Francisco Foundry, San Francisco, and at Hough & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address **J. B. BAUX,** Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v3-5d

The Hansbrow Pumps ARE WARRANTED THE BEST.

FIFTEEN KINDS AND SIZES, Adapted for FARM,

Mill and Mining Purposes.

"Safety Cages."

(PATENT GRANTED.)

MINING COMPANIES

WILL FIND IT TO THEIR INTEREST TO ADOPT "Berry, Hochholzer & Denver's Safety Cage" in their hoisting works. It requires very little more work to manufacture than the ordinary style of cages—any blacksmith can make it. It has been PROVED TO BE PERFECTLY SAFE, is self-acting and very light, and will, in the item of rope alone, pay for itself in a short time.

The proprietors refer to the following mining companies, among others, that are now using this Safety Cage:—Gould & Curry, Savage, Ophir, Mexican, Empire, Overman and Justis.

For particulars and terms, apply to

HUGO HOCHHOLZER,

Virginia City, Nevada, Through Wells, Fargo & Co's Express.

15v11

THE SAN FRANCISCO

BOOT AND SHOE NAILING MACHINE.

THIS MACHINE MAY NOW BE SEEN IN DAILY OPERATION at the corner of Stockton and O'Farrell streets, where the inventor may be seen and consulted at all hours.

He is especially anxious that Boot and Shoemakers, Mechanics generally, and all persons interested in the success of California inventions and California manufactures, should call and examine this specimen of California ingenuity.

The proprietor is making arrangements for their manufacture in this city, and he is now ready to contract to furnish the machine to such parties as may be desirous to purchase the same.

San Francisco, June 22d, 1865.

E. T. BARLOW,
25v12

LEFFEL'S American Double Turbine

THIS WHEEL, WHICH HAS HAD THE most unprecedented sale of any water-wheel ever made, and which has given unusual satisfaction whenever used, is now for sale by **KNAPP & GRANT,** 310 Washington street, San Francisco, where persons desiring to use water-power can be supplied. These Wheels are adapted to use from 10 to 5,000 inches of water, and from 4 feet to 500 feet fall. Let us know how much water you have either in mill's inches or cubic feet per minute, what fall you have, and what power you require. Write or send for circular to

KNAPP & GRANT,

Leffel's Lever Jacks,

For railroads, cars, or wagons; Railroad Jacks for engines and cars; Track Jacks for leveling, with which three men, with a pair of these Jacks, can level more track in a day than twelve men working in the ordinary manner; also, Track Jacks, for relieving the axle of pressure to replace the brass. These Jacks are now in general use in the Eastern States, and give entire satisfaction. Also, Wagon and Track Jacks of the most superior make and kind. For sale by **KNAPP & GRANT,** 12v12-3m San Francisco.

To Ditchmen, Millmen and Others Requiring **IRON PIPE.**

M. E. ROSE, CORNER OF 9TH AND K STREETS, Sacramento City, has facilities unsurpassed on this coast for the manufacture of **IRON PIPE** of every description. He also has on hand a deep well **FORCE PUMP**, of his own invention and manufacture, well adapted for all wells. His tools being portable, pipe can be manufactured on the ground. 19v12

Steam Engines for Sale Low.

DIRECT FROM EAGLE WORKS, NEW YORK, EM-bracing all Made in Improvements, suitable for Mining, Milling, or other purposes. Will be sold at Manufacturers' rates and charges.

Apply to **A. E. CRANE,** 310 Washington Street, up stairs.

STODDARD'S CELEBRATED WATER FILTERS!

PURIFY RAIN, RIVER, OR SPRING VALLEY WATER R perfectly pure and healthy. Three sizes. Price, \$12, \$15 and \$18. For sale by

S. B. STODDARD, Corner of Battery and Pacific streets.

June 23, 1865. 25v12-3m

Union Amalgamator.

This Valuable Invention

IS FAST FINDING ITS WAY INTO GENERAL USE, NOT by means of combination of capital and influence, but on the strength of its own merits, and upon the principle that what is known to be good will be appreciated. Practical men acknowledge the **UNION PAN** to be scientific, the best, the cheapest, and most profitable. It now stands first on the list of all pans in use for the purpose of

Working Gold and Silver Ores.

It has been found that a low class of ores, also tailings from Mills, Sulphurets, etc., that will not pay to work with the common pans, may be worked with this and obtain large profits. The **UNION PAN** is manufactured in two sizes, and capable of operating upon large quantities of ore in the most efficient manner.

Parties interested in Quartz Mining, Mills, etc., will find it to their advantage to call and examine for themselves, and see its operation.

Gold and silver ores tested by regular mill process, at moderate cost, by **STRONG & CO.,** San Francisco Foundry, corner Mission and Fremont streets, where orders will receive prompt attention. 15v12-3m

BRUCKNER'S Mechanical Roasting Furnace

AWARDED A

PREMIUM SILVER MEDAL

—BY THE—

The Mechanics' Institute.

THESE FURNACES ARE NOW MANUFACTURED AFTER an improved mode of construction, which

GREATLY SIMPLIFIES THEIR OPERATION, and afford a much larger oxidizing surface to the action of heat and atmosphere.

The weight of a Furnace nine feet long by four feet in diameter does not exceed one ton.

THE IMPROVED FURNACE

will soon be more fully described and illustrated in the columns of the **Mining and Scientific Press.**

Parties wishing to erect such Furnaces, are requested to leave their orders with

T. KALENBURG, 19v12 416 Market street, San Francisco.

FLORENCE SEWING MACHINES!

COPY OF THE REPORT OF THE COMMITTEE OF AWARDS AT THE FAIR OF THE

AMERICAN INSTITUTE,

New York, 1865,

—TO THE—

Florence Sewing Machine Company, FOR THE BEST FAMILY SEWING MACHINE.

HIGHEST PREMIUM—GOLD MEDAL!

REASONS:

- 1st.—Its simplicity and great range of work.
- 2d.—The Reversible Feed Motion.
- 3d.—The perfect finish and substantial manner in which the machine is made.
- 4th.—The rapidity of its working and the quality of the work done.
- 5th.—The Self-adjusting Tension.

The "FLORENCE" was awarded the First and Highest Premium at the State Fair of California, the only Fair on the Pacific Coast at which any two double-thread Sewing Machines were exhibited in competition in 1865.

The "FLORENCE" received the only premium awarded by the Mechanics' Institute of San Francisco, in 1864 and 1865, to any Sewing Machine, Sewing Machine Company, or Agent. The claim of a competitor to a medal is without any foundation whatever.

Wherever the "FLORENCE" has been brought in competition with other Sewing Machines, it has always been declared the best. It is the most simple, the most substantial, the most efficient, and its use is easily learned. Every Machine sold is guaranteed in the full sense of the word.

Send for Circulars and Samples of Work.

SAMUEL HILL, General Agent, 20v12-14w 111 Montgomery street, San Francisco.

Rubber Belting, WITH COTTON FILLING.

A FULL ASSORTMENT OF 3 AND 4-PLY, NOW IN store and for sale by **THOMAS H. SELBY & CO.,** 22v12-3m Nos. 116 and 118 California street

Pacific Forge Company.

FORGING AND IRON WORK.

THE PACIFIC FORGE COMPANY HAVE JUST ERECTED, in this city, on Fourteenth street, near the machine shop of the San Jose Railroad, a large establishment for the purpose of forging and working in wrought iron. Our hammer is the largest upon this coast, and we are prepared to manufacture, at short notice, all kinds of heavy forgings, our axes, shafts, steamboat cranks, piston-rods, wagon axles, and other similar work. This is the first general shop of the kind erected in this State, and we solicit the patronage of the public. All orders executed at reasonable rates, and with promptness and satisfaction. 19v12-3m

Coal was first used as fuel in London in the latter part of the 13th century. But the smoke was considered so injurious to the public health that Parliament petitioned King Edward I. to prohibit its burning as an intolerable nuisance. He complied, and issued his proclamation against it. The most severe measures were then employed to abolish its use; fines, imprisonment, and the destruction of furnaces and workshops where it was used.

J. B. COX, BUSINESS AGENCY.—Makes private sales of Property and Business Places of every description, in the city and throughout the State; procures partners with large and small amounts of money; negotiates sales of mining property, and does a General Agency Business. Patronage solicited by mail, express, or by personal application at the office, 402 Montgomery Street, San Francisco, California. 2v1111

Knox's Improved Patent Amalgamator and Separator,

With Palmer's Patent Steam Chamber or Die.

For further particulars, inquire of
ISRAEL W. KNOX, or
W. A. PALMER, Inventors,
At the Golden State Iron Works, No. 19 First street, San Francisco.

VARNEY'S CONCENTRATOR,

With a disk 4 1-2 feet in diameter—total weight of Machine 350 pounds.
Is driven by one-eighth of a horse-power, and will concentrate eight tons of ore per day, and make the sulphur
clean. Larger ones do work in proportion to size.
IT CAN BE SEEN IN OPERATION AT THE PACIFIC IRON WORKS, SAN FRANCISCO. 22v12-3m

REMINGTON'S ARMY AND NAVY REVOLVER,

THE REMINGTON REVOLVER

Has been approved by the United States Board of Ordnance, and has so satisfactorily
met the requirements of the Government, not only in the field, but in the official
tests and examinations made by prominent officers of the Ordnance Department,
that it stands at once the most popular, serviceable and approved arm of the kind in
use. Upwards of 15,000 have been supplied to the Government within the past four
years, for the land and naval service, furnishing ample evidence of the estimation in
which the arms are held.
Simple and symmetrical in its entire construction, securely strong, of most modern
improvement in mechanism and material; its unequalled range and penetration, to-
gether with its durability, are points in its favor now well known, and which challenge a comparison with any other
pistol of the kind made in this country or in Europe.
The superior strength and capacity of the arm for constant and long use is apparent from the fact that the entire
frame is constructed of a single piece of metal, thus preventing the extension of some portions of the frame, from the
effect of firing—a serious defect in many pistols—in which the frame is composed of two or more parts.
The frame of the Remington Revolver furnishing a support above the cylinder, served to protect the
base pin (on which the cylinder revolves) from any undue strain to which it would otherwise be subjected, and which
would immediately render the line of fire from the cylinder to the barrel imperfect, thus destroying force and accuracy.
Another advantageous feature of the arm is the means afforded for the instantaneous removal of the cylinder from
the frame. This not only facilitates the cleaning of the pistol, but by the quick adjustment of the cylinder, one pistol
can be made as effective as two—and, considering the difference of weight, it is far preferable—by simply possessing a
spare cylinder loaded and capped to instantly replace the exhausted one.
The above is a general summary of the points of merit in the Remington Revolver which a trial of the arm
is only needed to attest. For sale at Manufacturers' rates, by

ALBERT E. CRANE, Manufacturers' Agent,
310 Washington Street, up stairs.

Steam Pumps,
FOR DRAINING MINES OR ELEVATING WATER TO
ANY HEIGHT.

PICKERING'S GOVERNORS
For Steam Engines.

TRY IT
STANDARD SOAP COMPANY'S
WASHING POWDER.

THIS POWDER IS SUPERIOR TO ALL OTHER PRE-
parations for washing and cleansing. It is made of pure
material, and contains nothing that will injure the finest
fabrics. Equally as good for using in hard as soft water.
One pound will make three gallons of beautiful soft soap.
Put up in wrappers of 1-lb each, and in wooden boxes of
10-lb bulk. Ask your grocer for a package, and test its
virtue. Manufactured at 207 Commercial street,
San Francisco. 19v12 4

Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make,

HOADLEY'S.
FOUR SIZES,
8, 10, 12, and 15-Horse Power,

HOADLEY'S.
3 to 40-Horse Power.

HITTINGER'S.
THREE SIZES,
5, 7, and 10-Horse Power

HITTINGER'S.
TWO SIZES,
5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DUR-
ability, and Economy, with the Minimum of weight
and price.
These Engines are favorably known, a large number
being in use on this coast for hoisting, pumping, threshing,
mining and various purposes.
Steam can be got up on these Engines in fifteen minutes
after reaching the place of operation, and the time, expense
of setting boilers, machinery, and "construction account"
saved, (which is often the difference between the successful
and unsuccessful prosecution of mining enterprises,) in
fact, the portable principle is the pioneer's friend, and en-
ables him to draw engines on their own wheels, to his cabin
door, and plant on the outermost confines of civilization
the saw and grist mill, and it has done and will do more
to help subdue the continent than any other of the modern
motors which are crowding society and normalizing the
world.

All sizes on hand from 3 to 30 horse power, with and
without carriages.
Also, Portable Saw and Grist Mills.
For sale by
TREADWELL & CO.,
19v12 Corner of Front and Market streets

CONTRIBUTED FOR OUR CABINET.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

CHRISTIAN ANDERSON, of West Point, sends us a specimen which he supposes to be tin ore. The sample resembles very closely "red hematite," a valuable ore of iron. We shall test it thoroughly and report.

MR. SCHREIBER, of Sacramento City, sends us a specimen from the Mountain Quartz Mine, El Dorado City. It was taken from a depth of 100 feet, and contains a large percentage of very fine looking sulphurets.

THE NINETIETH ANNIVERSARY of the independence of our country has come and gone. These anniversaries ever bring with them grand and interesting associations and reflections, calling forcibly to mind the great struggle in which our fathers and grandfathers were engaged, in the memorable contest which resulted in the separation of our country from its colonial dependence upon England. The great principles involved in that contest, and the indomitable perseverance and determination with which they were defended by a weak and scattered people against a great and powerful nation, have made that struggle one of the most memorable in the history of the world.

Of these anniversaries, the one which we have just celebrated is especially to be remembered. It was the occasion of a double rejoicing: first, for the original acquisition of the Independence of our beloved country; and second, for the happy termination of the dreadful struggle which we have just passed, in which we have so triumphantly vindicated the same principles which were at stake when our forefathers fought for that acquisition. The weather on Wednesday was unexceptionable. The procession, the literary exercises of the day, and the magnificent display of fireworks in the evening, were creditable to San Francisco and to the occasion.

CREDIT.—The article on our eleventh page, entitled "The New River (Trinity County) Mines," should have been credited to the *Trinity Journal*.

Change in Prices.

Single Copies of the MINING and SCIENTIFIC PRESS will hereafter be sold at FIFTEEN (15) CENTS. By City Carriers, 60 Cents per month; Monthly Series, 65 Cents. The rates of Yearly Subscriptions, at the office of publication, remain as heretofore—\$5 per annum. The price to News Agents will be advanced 1½ cents per copy. Agents in the Interior supplied. June 30, 1866.

NOTICE TO QUARTZ MINERS.

Hendy's Improved Patent Self-Discharging Sulphurets PRATER CONCENTRATOR Is Receiving Universal Favor.

Reference is made to the following Mills which are using the Prater Concentrator, with some of the improvements attached. The Self-Discharging Sulphurets has been more recently adapted, and the public attention is called to examine its workings:

STEPHENS' MILL, Humboldt County, Nevada.
CHRYSOPELUS MILL, " "
U. S. REESE RIVER MILL, Austin, " "
UNION MILL, El Dorado County, near Mud Springs.
NEW YORK AND EL DORADO CO., " "
And in use in other parts of this State; also in Idaho, Arizona, Colorado and Mexico.

As a further evidence of its worth, orders have been received recently from the proprietors of the following mills, all of whom are using these Concentrators, or have works in the immediate neighborhood of mills using them, viz.: One Concentrator ordered for the Coney Mill, Jackson, Amador County, by Messrs. Bigelow & Bro., of this city. Three Concentrators for the Spring Hill Mill, Volcano, Amador County. Two Concentrators for the Golden Gate Mill, Volcano, Amador County. Four Concentrators for the Raw Hide Ranch Mill, Sonora, Tuolumne County. Eight Concentrators for the Benton Mill, Bear Valley, Mariposa Co., ordered by Messrs. Dodge & Bro., San Francisco. They may be seen in operation at the GOLDEN STATE FOUNDRY, No. 12 First Street, San Francisco.

For explanation of the above engraving, and other particulars, send for a Circular.

A COSTLY RAILWAY.—The Charing-cross Railway, London, only about two and a quarter miles long, cost about \$20,000,000.

IMPROVED BLACKSMITHS' TONGS.

Every blacksmith or other person who has been in the habit of using blacksmiths' tongs, has often felt the inconvenience of changing from one instrument to another, as is requisite in handling iron of different thicknesses. The object of the invention herewith illustrated is to obviate that necessity, which purpose is accomplished by making the tongs adjustable, so that the same instrument may be used con-

stantly. This is done by constructing a ratchet of hooked teeth, as represented at C, on the part, B; and by a tooth, c, on the part, A, which locks into any tooth of the ratchet, according to the size of the iron to be held. The two parts of the tongs can in a moment be separated when necessary; and the construction is very plain and simple. The finished engraving shows the tongs set to hold a small object; and the dotted line shows them set wide open, to hold a large object. A patent was taken out for this invention on October 24, 1865, by C. W. Le Count, of Norwalk, Conn.

John C. Graff, 225 Front street, New York city, is sole agent for the inventor, and is ready to furnish them in any amount to the trade.

MINING REVIEW.—The semi-annual review on pages 21 and 22, is presented in this issue, in addition to our usual amount of reading. We are indebted to the proprietor of the *Mercantile Gazette and Prices Current* for the type and composition of the same.

The Annual Report of the Golden Rule Mining Company.

[SUBMITTED JULY 17, 1866.]

To the Stockholders of the Golden Rule Mining Company of Tuolumne County:

The annual meeting was advertised for June 10th, but no quorum being present an adjournment was advised for thirty days, when it is hoped a full quorum for business will be present. The report of the Secretary was submitted for the fiscal year of the company, ending June 30th, 1866, being the third year of our workings, since which time we have run a tunnel 509 feet through solid rock, cutting four large quartz veins, upon one of which only we have done any work. The tunnel gives a drainage eighty-three feet on the vein below the surface. We have also run a drift north on the vein 300 feet; also sunk a shaft 76½ feet below the drift, being 150 feet from the surface. The vein is a talcose slate and quartz mixed, of from ten to six feet wide. The present prospects of the mine are good, and it is hoped that the existing debts will be paid off during the coming year, and that the stockholders may receive small dividends, besides paying for further improvements in hoisting machinery, etc. The present superintendent, Mr. A. S. Phifer, to whose energy, perseverance and economy for the past three years the company is indebted for their success, is still with us. Our new water mill, of fifteen stamps, since the 19th of March, has been running principally on waste rock, of which he had some 2000 tons; this rock having been rejected as too poor to work in our small, old 5-stamp mill. Our average from this class of rock has been about nine dollars per ton, including what rock we took from the new shaft in sinking. The average number of men employed during the year is thirteen.

CRUSHING DURING THE YEAR—FROM JULY 1, 1865, TO JULY 1, 1866.

	Rock Crushed.	Ounces of Bullion.	Amount.
July, 1865	67	287	\$4,721 85
August	66	220½	\$3,769 24
September	65	263	4,393 60
October	41	117	1,950 63
November	46	87½	1,424 07
December	54	68	1,105 65
January, 1866	45	146½	2,568 73
February	148	101	3,159 89
March	230	141½	2,355 00
April	330	181½	2,795 17
May	170	81	1,372 31
Total	1,318	1,817½	\$30,511 62
Average yield per ton			23 19

The substance of these figures and report is, that there has been earned and divided to the stockholders a dividend of two dollars per share on 3,000 shares—\$6,000; having also completed a new 15-stamp mill and a water-ditch and reservoirs three miles in length, and all paid for out of the proceeds of the mine, less the present amount now owing—\$2,608.

The present Trustees of the company are—J. H. Tunney, J. T. Boyd, D. D. Shattuck, R. L. Pasture; President, Wm. Bosworth; Secretary, J. B. Russell.

No assessments have been levied the past year, and no revenue derived from any source except the yield from the mine.

Amount of Cash on hand July 1, 1865, \$3,465 05
The total yield of bullion has been 1,817½ ounces, netting in coin, \$30,511 62

Total 34,036 67

DISBURSEMENTS.

To Stockholders' account on dividends, Nos. 1, 2, 3, 4, 50c. per share.	\$ 5,743 73
To Mining account for labor, tools, timber, etc.	16,760 40
To account of New Mill of 15 stamps, paid.	10,604 35
To expenses account for Secretary's Salary, Rent, Traveling Expenses of Trustees, Express Charges, etc.	923 03
Liabilities at present time—	
Debt on New Mill account.	\$2,408 00
Debt on Mining account.	200 00

\$2,608 00

GEOLOGICAL EXPLORATION OF SONORA, MEXICO.

Messrs. Cummings and James Cherry passed through this city, a few days since, on their return to the East from a seven months' tour in Sonora, Mexico. These gentlemen were sent thither by certain prominent politicians and capitalists, who represent "the power behind the throne" at Washington, and who feel an interest in the future of that portion of Mexico. The object in view was to secure such reliable knowledge of its mineral and agricultural wealth and general features as would meet the desire for such knowledge among our people at the East. They had, also, other missions of less importance—to select and locate mineral and other lands under grants from the Government, and to examine into certain mining possessions for London capitalists, and to inquire more clearly into the merits and management of a number of the most noted mining enterprises of Southern Arizona and Northern Sonora. They informed us that they met with a most unexpected degree of success in all their missions, notwithstanding their explorations were necessarily carried on under many deprivations and in much danger from the unsettled condition of the country. Much of their time was necessarily spent beyond civilized habitations, and in the midst of the dreaded Apaches, in a region of country hitherto but little explored; yet quite as much risk and uncertainty was experienced among both Imperial and Liberal armed forces, as among those dreaded savages.

THE WELCH QUICKSILVER MINE.—The annual meeting of the Welch Quicksilver Mining Company, situated at Mount Diablo, was held at Clayton, on Saturday, the 7th instant. About 3,600 shares were represented, and the meeting resulted in the election of a new Board of Trustees, and by a two-third vote it was decided to remove the office of the company to San Francisco. The office will hereafter be located at the corner of Clay and Battery streets. The affairs of this mine are in a good condition. Two shafts are being put down, one of which is sunk near forty feet, and the other about sixty, both of which are yielding good pyrite. There is also a tunnel being run to strike the vein some 200 feet below the croppings. The tunnel is now in about 160 feet, with good evidence of close proximity to the lead. A statement by the Treasurer of the company was made, which showed that over \$5,000 had been received from quicksilver taken from the mine since March 1st. A remark was made by an English engineer upon this, showing that if the mine was situated in Europe the stock would now be at par.

ASSAY OFFICES.—The House Committee on Mines has reported a bill to establish offices for the assay of gold and silver at Portland, Oregon, and Boise City, Idaho. It also repeals the act establishing a Branch Mint at Dalles City, Oregon. It will probably pass.

PEPPERMINT.—It appears from the returns of the Internal Revenue Department that \$90,000 worth of essence of peppermint was manufactured in the State of Michigan during the year 1865.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Source of the Electric Current in the Voltaic Battery.

BY EDWARD PIQUE.

[Continued from Page 2.]

I copy now the facts as explained in Smee's Metallurgy:

1. Zinc reduces zinc by taking a piece of the metal and doubling it. One-half is then to be amalgamated, and placed in dilute muriatic acid, and the unamalgamated into a strong solution of chloride of zinc, made as neutral as possible, when its affinity for the chlorine of the muriatic acid is sufficiently great to cause zinc to be reduced at the other end of the same piece of metal.

2. Copper reduces copper; for if a test tube be half filled with sulphate of copper, and then muriatic acid be poured gently at the top, so that the two fluids do not mix to any great extent, and a copper wire be then placed throughout the whole length of the tube, the copper in the acid will rapidly dissolve, whilst copper will be deposited at the lower part of the vessel. Copper will undergo no action alone, either in muriatic acid or sulphate of copper.

3. Silver reduces silver by placing one end of a silver wire in a porous tube containing nitrate of silver, the other in dilute sulphuric acid, though the metal placed in either separately is not affected.

4. Lead reduces lead by immersing one end of a piece of lead in a solution of the trinitrate of lead, the other in dilute nitric acid.

5. Tin reduces tin by placing one portion of a piece of metal in muriate of tin, the other in muriatic acid.

6. Gold even reduces gold by immersing one end of a gold wire in the chloride, the other in dilute muriatic acid, the two solutions being separated by a porous diaphragm.

Mr. Smee concludes with the following ultimatum:

"From the various experiments which I have examined, voltaic effects may be defined to be 'certain effects produced by the chemical action of a body on one element of a compound, and manifested between this point of action and the evolution of the second element.'"

I must confess I do not quite understand this final definition. There is some kind of mystery in it. Besides, all those above facts of metals reducing metals of the same kind, instead of proving a chemical action to be the source of galvanism, just straight-forward prove the very contrary.

I would like to know where the chemical action is. If we immerse gold in muriatic acid, and leave it there for a year, it will not dissolve; but if we separate muriatic acid and a solution of chloride of gold by a porous diaphragm, and cause a gold wire to dip simultaneously in both solutions, only then one end of the gold wire will be dissolved in the muriatic acid, during which the other end of it appears electronegative, and reduces the gold from its solution. But there was no chemical action until the two fluids have been connected by a metal.

There is no chemical action between amalgamated zinc and dilute muriatic acid, neither is a chemical action between copper and silver and dilute sulphuric acid, etc.; and as there certainly is no chemical action going on in the beginning between the metal and either of the two solutions, we cannot ascribe any effect to anything that does not exist.

I certainly believe the contact theory to be the only one that can throw light upon this matter; meaning not only the contact of two metals, but the contact of any two conducting bodies of a different nature, so that a galvanic battery might consist of two metals, or two fluids, or one metal and one fluid, etc.

Before arriving at any final conclusion, I wish to copy from Dr. Scholz's work a few interesting facts. He gives first a description of a galvanic pile, constructed by Zamboni, consisting of a number of watch-glasses filled with water, and connected by pieces of tin-foil in the shape of a disk, with a strip attached to it, so that the disk or wide part of the tin-foil rests in one glass, but the tail or strip dips in the water of the next watch-glass; the first disk shows positive, and the last little tail negative electricity.

But more interesting than this is the following fact, as stated by Dr. Scholz: "If we pour water gently on the top of the sulphuric acid, to prevent their intermixing, and immerse a platinum wire through both these fluids, electricity will be visible by the decomposition of the water." The first experiment with tin-foil and water shows only that neither two metals nor two fluids are necessary to produce galvanic electricity, and that the contact of any two bodies will generate this power, provided they are conductors. But the last experiment with *platinum water and sulphuric acid* is an incontestible and positive proof that no chemical action is required to produce galvanic power. This little experiment speaks volumes. Platinum, the noblest metal, which, certainly, is not the least acted upon by sulphuric acid, neither dilute nor concentrated, neither warm or cold, neither in a long nor a short space of time, still produces galvanic action when immersed in water and sulphuric acid; and I really believe that galvanic power could be produced by a proper arrangement of platinum and nothing but water.

I wish to mention here a little fact, which seems to me an additional proof that electricity is the cause of the action in a galvanic battery. It has been stated as a law that in a compound battery the amount of action in every single pair is precisely the same, following the proportions of chemical equivalents, and that the electric and chemical action is going on in every vessel proportionate to each other. Now, if we construct a compound battery of three or four pairs, and decompose by its means a solution of the auro-cyanide of potassium, using as positive pole a piece of platinum; this will by no means be chemically acted upon, and still the gold will be deposited on the negative pole in the same proportion as if the positive pole had been a piece of gold which would have been dissolved.

Now, we certainly cannot speak of a chemical action on the platinum, and the gases that are evolved on it are only the consequence of the electricity and deposition of metal on the negative pole. I shall now, in a few words, recapitulate the reasons I have given that electricity is the cause of galvanic action, and that chemical changes are only the consequence of it:

First Proof.—Two metals produce electricity by contact.

Second Proof.—In a battery there is no chemical action of any kind until all the connections are made.

Third Proof.—The action commences on the negative plate, as I have shown, that in a protected sulphate of copper battery the copper solution becomes exhausted, and the zinc solution saturated.

Fourth Proof.—We obtain the most power when the negative plate is larger than the positive.

Fifth Proof.—Platinum as positive pole in any metallic solution will not be chemically acted upon, and still the metal will be deposited on the negative plate.

Sixth Proof.—A battery, according to Dr. Scholz, can be made by pouring water gently on the top of sulphuric acid, with nothing but a platinum wire passing through both liquids. This proof alone is sufficient to show the fallacy of the chemical theory of the pile.

In conclusion, I will now give my ideas about the reason why the contact of two metals produces electricity, and after that the influence of the electricity so produced on different solutions.

The great Franklin and some other philosophers, stated that there is only one kind of electric fluid which is intimately connected with every thing in nature. This electric fluid does not manifest itself to our senses by any phenomenon, as long as all the bodies possess a certain proportion of it assigned to them by nature, but which causes very astonishing effects if the electric fluid in any matter becomes accumulated beyond its ordinary point of saturation, or if the bodies are deprived of a part of the electricity which they commonly possess. In the first case they said the bodies are charged with *positive*, and in the latter case with *negative* electricity. In either case they called them *electrified*, believing that the *positive*, having more electricity than they require, strive to part with the excess of it to the surrounding bodies, and the *negative* being in want of it, try to deprive the surrounding bodies of what they themselves need; and in this way both kinds of electricity produce visible effects, in many respects resembling each other, although in some ways entirely different and contrary. According to this doctrine, we might say that, for instance, copper has within the same space a larger quantity of electricity than zinc according to their nature. In consequence the electricity must be in the copper in a more compressed state than in the zinc.

Now, if brought into contact, both being good conductors, it does appear likely that the electricity in these two metals tries to equalize its tension in the same way as caloric will do by the contact of a hot and a cold body, if they are good conductors of heat. The copper having a larger amount of electricity will give a part of it to the zinc. If such is the case, the zinc will receive a larger amount of electricity than is consistent with its ordinary state, and the copper will be deprived of it, so that both of the metals will be in a kind of unnatural state, in consequence of the disturbed equilibrium, making the copper negative and the zinc positive electrified. Now, it appears to me the action of these two differently electrified metals on anything interposed between them must be an *induction of electricity or polarization*, so that the part of the fluid touching the negative plate will assume positive, and the opposite end of the fluid near the positive plate, the contrary electricity.

If, instead of a fluid, a solid body, for instance, a metallic cylinder, would be subjected to the influence of electricity by induction, the opposite ends of this cylinder would assume contrary electric states, but no material change would take place on account of the immovable condition of the particles of a solid body. With a fluid it is different, as the opposite ends will not only assume contrary electricity, but an actual transfer of the constituents will take place, so that a column of water, whose electric equilibrium has been disturbed, would, on one end touching the negative plate, actually have one atom of hydrogen laid bare, and on the other end the corresponding equivalent of oxygen. But even this fact would not account for the evolution of the two gases, because the electricity will be *disguised*, and the attraction between the electric fluid of the metallic plates, and the contrary electric state of the liquid touching them, would rather prevent than cause the evolution of the two gases.

To explain this fact, we must consider what kind of fluids are capable of being decomposed by galvanic electricity.

Neither a fluid that is a perfect conductor (like metals), nor a fluid that is a perfect insulator of electricity (like oil), are capable of being decomposed by voltaic action; it must, necessarily, be a liquid that is neither a perfect conductor nor an insulator; it must allow the electricity to pass, at the same time putting an obstacle to its passage.

Now, what will be the consequence of this? It must be that a part of the electricity will actually pass and produce polarization and a transfer of the opposed constituents of the fluid to each end of it touching the poles. At the same time, another part of the electricity being stopped in its passage, will accumulate at the plate where it comes from, and will, for instance, as the negative plate connect with the hydrogen, which has been transferred to it by induction, charging the hydrogen with negative electricity, making it unfit to remain any longer connected with the oxygen. It will, therefore, leave its connection, and either escape or reduce some oxide contained in the solution.

But, now, the negative plate by this operation has spent all the free electricity imparted to it by the contact with the positive metal, and it cannot receive any fresh supply from it, unless the tension of positive electricity in the zinc is removed, so as to reduce it to its normal electric state. This is simply accomplished by the chemical connection of a part of the zinc with the free equivalent of oxygen in its vicinity, after which the remaining zinc will be in its natural electric state, and be able by contact to impart a new portion of negative electricity to the copper, and so forth. If there would be no dilute acid to dissolve the oxide of zinc thus formed, the action would soon cease, on account of the oxide encrusting the surface, and preventing any further connection between the zinc and oxygen to take place.

In confirmation of this idea, I wish to mention one single fact out of a thousand similar ones. If we mix hydrogen and oxygen together, they will not form a connection, not until we pass an electric spark through the mixture, when they will immediately unite, forming water.

I believe that by the electric spark we impart to the hydrogen the proper condition to unite with the oxygen, and we might just as well say that by charging the hydrogen in the galvanic battery with negative electricity, we make it unfit to remain any longer connected with the oxygen, and it has to leave it, being now in the same condition as it was before the connection. The same reasoning might be applied to the metals contained as oxides, chlorides, and so forth, in the different solutions.

In writing the above article nothing influences me but a desire to seek the truth, and I should be very thankful if any natural philosopher would either approve or improve or contradict my notions, as either will be productive of clearing up truth, and I believe that the theory regarding the source or origin of the galvanic power should be positively settled before we can expect to derive any great practical benefit from it.

[Written for the Mining and Scientific Press.]

The Black Rock Mines.

EDITORS PRESS: The Black Rock country has often been mentioned in your paper, and in other local journals, and consequently your readers are quite familiar with its locality.

Various statements have been published as to the value of the mines discovered in that section of country; but they are all so contradictory of each other that the public at present does not know what to believe; or whether the reported rich mines are to be found there or not.

Whatever these reports may state, we must take them for what they are worth, and admit facts only in forming our judgment. Numerous assays have been made here, and in other parts of the Pacific coast; some assayers have been very fortunate; others have failed to obtain either gold or silver at all. This has been especially the case with some San Francisco assayers, and of course the Honey Lake Valley people say we don't know how to assay here. I have assayed more than 100 samples from Black Rock, and I am sure that seventy-five out of the number have contained gold and silver, from a low percentage up to \$900 per ton. I have also worked several small lots and obtained equally good results, and I am sure if the same kind of ore had been handed to other assayers, they must have discovered the presence of the precious metals.

The lodes or ledges in Black Rock are from twenty to sixty feet wide, and some strikes in those veins are very rich, and I think that half of those which came under my observation will pay for working. In none of the lodes have they sunk more than five feet, and for croppings I think the prospects are as good, if not better, than those from any district ever discovered in Nevada.

The people of Honey Lake Valley did not spare any time or money to prospect that district thoroughly, and especial credit is due to Mr. Harvey for his perseverance and endurance in testing the value of these mines. Beside the assays and small lot operated on, the ore has now been tested by actual working, and I have at present a bar in my possession which has been extracted from 3,800 pounds of ore at Captain Dall's mill, in Washoe Valley. The ore was from the Merrimack ledge, and paid \$48.85 per ton in gold and silver (of which 20 per cent. is gold). Another lot from the Monadnock paid \$256. These facts show that there are silver mines there. When we consider that the ore worked was not selected, and in no instance was taken more than two feet from the surface, these reports are very encouraging. It is hard to select this ore, as it looks all alike, rich and poor.

I have no further interest in the matter, than to verify the assertions made that the Black Rock mines are real mines and no fiction; and I think that before this summer closes, we shall have several mills there, and have another field opened for capital and enterprise.

J. MOSHEIMER.

In the streets of Paris, as in many other European cities, the traveler will see people seated at tables in out-of-the-way corners and shady nooks, who practice occupations which are never followed in the open streets with us. A very common person is the man who writes and directs letters for those who cannot write themselves. Another practices cobbling, and still another tells you by a rough sign-board, and by word of mouth, that he will pull your teeth at low rates—two cents for a front tooth, and three cents for a back one. (San Francisco dentists have a habit of charging from two to five dollars for like operations). But one of the oddest of these out-door practitioners, is the old woman who mends stockings in the market-place. The half of a hoghead, a chair, and a few hoops bent above and covered with an old rug, with a pair of spectacles, a needle and skein of thread, constitute her cheap and simple outfit. The boys and workmen in the markets employ her to mend their stockings while they themselves pat about barefooted until they are done.

FIVE gold mines in Merionetshire, England, yielded, in 1864, 2,336 tons of quartz. This was crushed and amalgamated, and gave 2,887 ounces of gold. This is nearly one and a quarter ounces to the ton, worth over \$21 in coin.

Mechanical.

A NEW MATERIAL FOR SOLEING SHOES is said to be coming into use, of which India-rubber is the basis, but it is heavier, and has a solidity almost of iron, yet a flexibility and elasticity which renders it a most perfect substance for the purpose for which it is specially offered. It is not all of the vulcanized rubber character, though it appears at a glance to be like that material. As an article for soles it is said that it will outwear four pairs of the best English leather. The substance is not to take the place of the ordinary leather sole, but is to be applied by a peculiar cement to the boot or shoe, to which it appears to adhere perfectly. It is then pared up the edge, and the work is over. Heels are put on in the same way. The inventor says a pair of soles, worn daily, will last one year. It is patented and will soon be introduced. It is claimed that any one possessing an ordinary shoe-knife, a sand-stone to sharpen it, a box of the cement, and a few pounds of this substance, can set up a shoe shop, and the regular shoe trade can make it a most profitable branch of industry.

PREVENTING IRON FROM RUSTING.—It has been already observed, as a quite remarkable fact, that the extremely thin sheets of iron which have lately been rolled in this country and England, to show how thin iron could be rolled, possess a great power of resisting oxidation. The cause of this peculiar property was not at first understood, but careful examination has recently shown that it is due to an exceedingly thin fused layer of magnetic oxide with which they are always covered; and the fact has been applied to the protection of articles of wrought-iron. The latter are imbedded in a pulverized layer of native oxide of iron—hematite, for instance—and kept at a full red heat for several hours, after which they are allowed to cool gradually. Plates treated in this way are perfectly covered with the oxide, and are well suited for ship-building. A combination of the oxides of zinc and iron, formed by the use of the oxide of zinc, also in the process, gives rise to a black coating, which is, perhaps, even more effective.

NEW NON-METALLIC RESISTING SUBSTANCE. Some curious experiments have recently been made in Genoa, with a new non-metallic substance, designed to resist the force of projectiles. In the experiments a breast-plate was formed of this new composition, which is extremely light and flexible, and entirely free from any admixture of metal, and which was placed upon a straw stuffed figure, and became a target for all who might feel desirous of testing its power of resistance. The conical bullets of a revolver, discharged at ten paces distance from the figure, glanced off the breast-plate and fell to the ground, and neither the projectiles nor the object which they had struck seemed any the worse for the operation.

Iron and copper smelters have hitherto avoided the presence both of alumina or clay and lime in their furnaces on account of its refractibility. But Mr. Freney has proved that an aluminate of lime, containing eighty of the former to twenty of the latter, or better still, ninety to ten, is more fusible than a silicate of the same earth. He also discovered that an aluminate of lime containing more base, eagerly absorbed sulphur and phosphorus, and consequently improved iron or copper made in their presence.

HOTEL TELEGRAPHS.—Some of the European hotels are utilizing the electric telegraph greatly to the convenience of their customers. In each room of the house a telegraph is arranged, with signals explained and posted up so that they may be readily understood by any guest. The names of the different articles which can be ordered by telegraph are given with the proper signal for each. When anything is wanted the customer presses a button marked "bell," and then sends the order by pressing the button under the article named on the board. In a very short time whatever may be required is brought in. The machinery attached to the telegraph is so simple that it can easily be worked by any one.

THE BESSEMER PROCESS.—We have already stated that Mr. Bessemer has an American rival in addition to his English rival, Mr. Mushet, who claims priority of date in the discovery of his process for making steel. We now perceive that a late correspondent of the *London Mining Journal* presents another name as antedating the entire trio. That writer says:

The system of forcing air through molten metal, to give it a steely texture, is not due to either Mr. Mushet or Mr. Bessemer; and the use of manganese (which is all that gives advantage in the use of spiegel-eisen) was suggested and used by Robert Heath almost before Mr. Mushet knew that the iron trade existed. But this is not the sole reason that would lead me to urge that as little as possible should be said about the rights of the several claimants; it is very currently reported, and I am not aware that Mr. Mushet has denied it, that a pecuniary consideration has been paid as a compensation to him, upon condition that he should raise no claim to the invention. When this arrangement was made no doubt was entertained on the part of Mr. Bessemer that the claims of Mr. Mushet were unfounded, but it was thought to be preferable to make a money sacrifice rather than have a really useful invention prejudiced in the eyes of the public, more especially as it was intended to form a company to develop the invention.

NEW SOURCE OF MAGNETISM.—A new and singular source of magnetic iron has been discovered. It appears that the shavings of iron and steel, and especially the long spirals produced in turning iron on the lathe, are highly magnetic, especially in case of soft iron. This magnetism is permanent, and M. Greiss, the discoverer, has observed that the south pole is always at the end which is first touched by the tool.

IRON IN MISSOURI.—The Iron Mountain is not the only large deposit of iron in Missouri. Near Staunton, there is what is known as "Iron Hill," covering a base of some two or three acres, yielding an ore worth from 60 to 75 per cent. of iron. "James' Iron Hill" is another locality of a similar character. There is a peculiarity about the "Iron Hill," which we believe does not elsewhere occur—the gulch which bounds it on one side is said to be rich in indications of copper, while the hills on the opposite side of the gulch abound in lead.

The deposits of iron ore from which England draws her chief supply of iron, are supposed to be fresh water formations, deposited at first as hydrated peroxide of iron, just as the bog ore now forming in Swedish lakes, and afterward reduced to the carbonate by the presence of decomposing organic matter.

HARDENING COPPER.—It is alleged that one Dinsman, of Upper Sandusky, Ohio, has discovered a process for hardening copper, and has secured a patent for it. A correspondent, referring to the process, says: The material is properly called silicated copper, and can be worked without friction. All necessity for oiling machinery made from it is obviated. The writer says the Cleveland, Columbus, and Cincinnati railroad is now testing the prepared metal, and in case of its success is prepared to give the inventor \$10,000 for its use on the road. There is much excitement and interest in Upper Sandusky over the subject.

THE SWIFTEST VESSEL AFLOAT.—The Mahroussa paddle-wheel steamer, just built for the Egyptian Viceroy, and now on her voyage out, is said to be, without exception, the fastest vessel afloat. At the measured mile in Stokes Bay her average speed was about twenty and a half statute miles an hour. Her cost is said to have been \$166,000.

CHLOROFORM.—It is suggested in the *London Chemist and Druggist* that chloroform is an excellent medium for the removal of stains of paint from clothes, etc. It is found that portions of dry white paint, which resisted the action of ether, benzole, and bisulphide of carbon, are at once dissolved by chloroform.

USEFUL INVENTION.—A soldier who needed it has invented a left-handed knife and fork combined, with which a person who has lost his right arm can feed himself very conveniently.

FIRE BRICK IN COLORADO.—Messrs. Bell & Co. are turning out about one thousand a day of the handsomest kind of fire-brick at their works in Golden City, Colorado. They have now orders for some 20,000 or 30,000 ahead.

Swimming.

Swimming is a most useful art, and one that is easily learned; yet there are many persons who never make the effort to learn. Hundreds of lives are lost every year which might have been saved if the unfortunate victims had only known how to swim. There are most excellent opportunities in this city to learn the art of swimming. At least two swimming schools are constantly in operation. A gentleman who has been very successful in teaching this useful art has published the following very simple method by which any father may readily teach his son; or by which any boy can learn to swim without the aid of a teacher:

1. Make the boy's desire to learn as strong as possible.
2. Get his confidence. Let him feel assured that you will not play him any tricks or allow any others to do so.
3. Stand him in the water up to his neck if possible, if not, then as deep water as you can get him into.
4. Place one hand on his chest at the centre of gravity, and the other on his back, opposite to the first.
5. Tell him to strike out and kick, supporting him at the same time properly in the water.
6. Correct steadily the motions of his arms and legs and the positions of his hands and feet, until they are exactly what they ought to be. One method of teaching him the proper motions of his legs is to place him in shallow water, so that he can rest upon his hands with his head to the shore. You can then observe and correct his kicking, and, if necessary, catch hold of his feet and guide his motions until he gets the right idea.

You can also teach him the proper motions at home by balancing him upon a bench or chair, just as the Russians are said to teach young sailors on dry land by making them climb masts and handle rigging. This is in fact an approximation to the anxious mother's idea of not allowing her boy to go into the water until he knows how to swim. It also saves valuable time in the water, for some boys soon get chilled, and one must keep a constant eye upon them.

7. Relieve the monotony of this part of your instruction by letting the boy stand while you swim around him, or letting him jump toward you from a rock into the water so that you can catch him and lift him out, or, still better, by letting him swim in any fashion he can, while you support him toward some definite object, such as a rock or a stake.

8. As soon as his motions are correct, tell him you will let go of him while you count one, but remove your hands only a short distance from him so as to be able to catch him instantly. Then count two, then three, etc., counting aloud so that he can hear you.

9. Don't attempt to go any faster than the boy wishes to go. Courage and confidence are sometimes of slow growth, and any hurrying is pretty sure to retard.

10. Never count more than you agree to, for the only result will be to frighten and discourage.

WOMEN.—Theodore Parker, in one of his sermons, uttered the following remarks touching women:

"There are three classes of women: First domestic drudges, who are wholly taken up in the material details of their housekeeping and child-keeping. Their housekeeping is a trade and no more, and after they have done that, there is no more which they can do. In New England it is a small class, getting less every year."

"Next, there are domestic dolls, wholly taken up with the vain show that delights the eye and ear. They are ornaments of the estate. Similar toys, I suppose, will be more cheaply manufactured at Paris, Nuremberg, at Frankfort-on-the-Main, and other toy shops in Europe, out of wax or papier-mache, and sold in Boston at the haberdasher's by the dozen. These ask nothing beyond the functions as dolls, and baffle all attempts to elevate womankind."

"But there are domestic women, who order a house, and are not mere drudges, adorn it and are not mere dolls, but women. Some of these—a great many of them—conjoin the useful of the drudge and the beautiful of the doll, into one womanhood, and have a great deal left besides. They are not wholly taken up with their functions of housekeeper, wife and mother."

THE LABARUM.—This was the name given to the military ensign of the later Roman Emperors. It was composed of a long pipe, made in the form of a cross, from which was suspended a bandol ornamented with gold and precious stones. Constantine placed on the summit a crown emblazoned with the monogram of Christ. The standard was usually accompanied by a guard of fifty picked men, who were believed to be invincible while in the discharge of their duty.

TREATMENT OF COPPER ORES.—The number of processes which have from time to time been brought forward for treating copper ore is, doubtless, large, but except in isolated instances they are still unused, and now that something is really required to aid the mine adventurers, so fertile a source of profit should certainly not be passed over. There is room enough for all, and, therefore, no inventor should be condemned until his processes have been fairly tested—the result will in most cases be a large profit to those who have sufficient confidence to give their support.

Nearly ten years since, amongst the many ingenious processes sought to be introduced was that of Mr. William Henderson, of Glasgow, and some valuable improvements upon it have just been patented by the same gentleman. He states that the improvements relate to means of obtaining in solution copper when it exists in the state of oxides, carbonate, arseniate, or other salt of copper, associated with large proportions of silica, or other substances insoluble in dilute acids. When the salts insoluble in water are dissolved out by muriatic acid, and the copper precipitated by iron, a solution of protochloride is obtained, which has usually been allowed to run to waste, or be decomposed by evaporation; but Mr. Henderson has found that by treating the protochloride of iron in this manner a considerable proportion is decomposed into chlorine and oxide of iron, and that the gaseous chlorine passes up through the water, and escapes from the tower uncondensed. He has also found that the perchloride of iron has a strong solvent action on the oxides, and the salts of copper insoluble in water, and that it readily dissolves copper from ores of this class depositing peroxide of iron, and that by long contact it decomposes and dissolves the red oxide and sulphurets of copper; and he now proceeds in accordance with his increased experience.

THE POISON OF THE RATTLESNAKE.—Dr. J. W. Burnett recently related before the "Boston Natural History Society" some experiments and investigations made with the rattlesnake, which will be found interesting to those inclined to pet the venomous beasts. The virulence of the poison of these animals is too well known for special description; I will only add, there is good reason for the belief that its action is the same upon all living things, vegetables as well as animals. It is even just as fatal to the snake itself as to other animals. Dr. Dearnley had a snake confined in a cage, which he irritated, and subsequently dropped some chloroform on its head, under the influence of which he extracted some poison from one of his fangs. He then took some blood from one of his own fingers, with which he mixed a minute quantity of the poison, and immediately thereafter submitted it to examination under the microscope. The corpuscles ceased to run and pile together; but remained stagnant without any special alteration of structure. The whole appearance was as though the vitality of the blood had been suddenly destroyed, exactly as in death from lightning. This agrees also with another experiment performed on a fowl, where the whole mass appeared quite liquid, and having little coagulable power. The physiological action of this poison in animals is probably of a most powerful sedative acting through the blood on the nervous centers. This is shown by the remarkable fact that its full and complete antidotes are the most active stimulants; of those alcohol, in some shape, is the first.

THE ART OF PRINTING.—D'Israeli believes, and brings up a mass of evidence to sustain him, that the art of printing was known to the Romans, but that they rejected it as unsuited to their civilization, and that the Emperors were bitterly opposed to it, as in it they recognized a powerful enemy to their tyranny. They did, however, make use of it on a small scale. The Emperor Justinian had a stamp on which were engraved or carved the letters of his name, and had made constant use of this for signing documents. Theodoric did the same. The moveable letters with which the Roman potters stamped their wares were similar to those used by the book-binders of the present day for lettering, etc. The Romans were also perfectly familiar with printing ink, and their refusal to make use of the printing press must be attributed either to the opposition of the Emperor, or the popular belief that it was not suited to such high civilization.

It costs each member of the Baptist and Methodist sect \$3 40 a year; the Presbyterian, \$6; the Congregationalists, \$10; the Catholics, \$14; the Episcopalians, \$18; the Reformed Dutch, \$22; and the Unitarians, \$23.

A MINIATURE MAGNET.—Sir Isaac Newton is said to have had a magnet set in a finger-ring, which, though weighing only three grains, could sustain 746 grains.

VANDIO ACID is worth \$150 per ounce, yet the clay bed which underlies London is estimated to contain 303,443 tons.

[From the San Francisco Mercantile Gazette and Prices Current.]

SEMI-ANNUAL MINING REVIEW.

The favorable views expressed in our last quarterly report upon the subject of mining in California, may be repeated at this time, inasmuch as the business has since in like manner continued to flourish, even undergone further improvement in some of its branches. At no time, perhaps, within the past ten or twelve years has there been a period when this pursuit has proved more generally remunerative and satisfactory than within the last six months, or when it has presented such gratifying evidences of future stability and success. The copious rains that had fallen in the earlier part of the season having been continued to a much later period than common, has had the effect not only to relieve the miner in many places from the necessity of buying water, but by affording prolonged and unwanted facilities for placer working has greatly stimulated that branch of the business, and secured to it much larger returns than had of late years been usual. The river bars and smaller gulches once the principal scene of mining labor, being now nearly worked out, active operations in this department have been transferred to the deep, buried, and basin-like flats, hill diggings and higher benches, or to the gravel and cement ranges that mark the sites of lacustrine and glacial deposits, and the site of ancient rivers, which promise to open up a system of placers far more lasting than those superficial formations which, though so easily reached, and once so prolific, are now nearly exhausted. Into this new field the business of mining, aided by capital and a long experience, is now being carried with an energy and on a scale unexampled in its earlier history. Into its service water has been pressed to a much greater extent than formerly, being brought to bear on its work through the agency of sluices, hose and other hydraulic gear, whereby its force can be made to apply with the greatest practical effect. For collecting and conducting this element to the points where required for use, reservoirs covering hundreds of acres of land, and aqueducts hundreds of miles in length, have been built, at a heavy outlay of labor and money, while tunnels, shafts and open pits without number, have been dug either for purposes of exploration or drainage, or for bringing the auriferous earth when found, to the surface. Latterly, stamping mills for crushing the indurated gravel and cement are being largely employed in this branch of mining; and scarcely a month passes but we hear of some new agent or novel contrivance being brought into use for expediting the labor or economizing the cost of separating the free gold from the worthless material in which it is embedded. Even the more common elements—the rain, frost, atmosphere and heat of the sun are availed of for this purpose, immense quantities of tailings, after being exposed for a year or two to these influences, often paying well for washing over a second or third time. The business of re-washing this refuse matter will be carried on quite actively at a number of points the present summer, owing to the unusual facilities for washing the same. The discovery and development of additional cement and gravel beds, the opening up of new basins by bed rock tunnels, the re-working of tailings and the finding of fresh diggings at various points, in some cases outside the limit of our original gold fields, indicate for this class of mining a good degree of prosperity the present year, and tend to show how very far our placers are from being worked out. If, indeed, we have more than just begun to prospect them. That these cement ranges, though less easily exploited, will eventually prove more permanent and productive than the superficial placers is the opinion of our most intelligent geologists and miners; hence we find numerous projects—some of them of a very formidable character, and backed by ample means, have lately been set on foot for the purpose of working such claims as had already been reached, or pushing the work of exploration still further into the subterranean gold fields. These cement and gravel beds, though supposed to exist in all parts of the great gold bearing belt of California, have not been much developed, except in the more northern and central portions of the tier of mining counties. As yet, the system has been found more prevalent in Sierra Nevada, Placer and Eldorado counties, where, in fact, the most extended research has been made. Though similar in their geognostic situation, the strata of gravel are thought to be the result of glacial action, and to be anterior in the period of their formation to the cement deposits, the latter being ascribed to fluvial action. These beds are reached at depths varying from 50 to 300 feet beneath the surface—are from one to ten, and in some places even twenty feet thick, their horizontal breadth varying from one hundred to two or three thousand feet, and in some cases more—the gravel generally having a greater breadth than the cement strata. In a few places this substance is so soft and easily separated that the gold can be extracted from it by the action of water. The greater portion, however, is so indurated and tenacious as to require crushing in a battery, after which it is amalgamated and otherwise treated like auriferous quartz. Much of it is found to be rich in free gold, yielding a larger percentage of metal to the ton than quartz, while it is much more easily raised and reduced. In places the gravel is found to be especially rich in gold—car load, and occasionally a single pan yielding several ounces. Taken as a whole, these gravel and cement beds have heretofore proved a profitable class of diggings, single companies cleaning up after a month's run thirty, forty, and even as high as fifty thousand dollars. The gross annual product of the Blue Grass Co.'s claim, Butte county, is \$240,000. Within the past few years several other companies in that vicinity have done nearly as well, while in other localities not a few have been worked with large profit. Of late this description of claims has greatly appreciated in value, some but partially developed and in other cases before being opened at all, selling for large sums of money. One situated near Smartsville was disposed of not long since for the sum of \$115,000, the owner retaining an unassessable one-tenth interest therein. More recently several properties of this kind, lying near North Bloomfield, Nevada county, were sold, according to report—the one for \$159,000, and the other for \$200,000. The purchasers of these grounds will at once proceed to open them in the most effectual manner. Two other companies of large means have been organized within the past few weeks to carry on very extensive operations at another point on the same land, which has recently been traced to a much greater extent than it was formerly supposed to exist. While from some portions of this cement and gravel the gold, as before stated, can be extracted by means of water alone, the greater and often the richer portion requiring the action of the stamps to set the metal free; and although a good many mills designed for crushing and working it have already been put up, their number is likely to be greatly multiplied hereafter.

In all parts of the gold regions of California alluvial flats of greater or less extent are met with—the supposed site of former valleys or lakes, now filled with surface washings and alluvial drift, but into which great quantities of gold had been carried and there deposited prior to their being so filled up. Many of these are crater-shaped; being surrounded with a rocky rim that precludes natural draining to any great depth, and which, before they can be worked to any advan-

lage, require the construction of bed-rock tunnels through which the water and tailings can be run off. These tunnels are often works of great magnitude, being many thousand feet long, costing immense sums of money, and requiring several years for their completion. But notwithstanding their cost, these enterprises generally prove lucrative, and so successful have they been of late, that those underway will be everywhere pushed ahead with energy, while many new ones will be undertaken the present season.

Owing to the generous supplies of water, this year has been propitious to hydraulic mining, which has accordingly in many localities been prolonged beyond the usual period, and everywhere attended with a good degree of success. The diggings into which this process is introduced with best effect are generally deep—sometimes a hundred feet or more and hence are apt to last for a long time. The mass of the dirt washed by this method is not expected to be rich, this deficiency being compensated for by the cheapness and dispatch with which immense amounts of it can be disposed of, thereby rendering it one of the most certain and remunerative branches of mining where good facilities exist for carrying it on. In its prosecution water is substituted for manual labor—a single hose pipe being made to do the work of many men, and rendering profitable the washing of vast bodies of earth that would otherwise be valueless. In the use of gunpowder, employed to shatter and loosen the earth—several hundred kegs being often used at a charge—is found another efficient ally and labor-saving agent in this class of mining. Latterly, also, steam has been brought into requisition, in a few cases, for raising water for hydraulic washing where it could not otherwise be obtained. Preparations for river-bed mining are being made at a number of points the present season. The mode of procedure here is to dam the stream, and diverting it into a flume, lay bare its bed which is then worked by means of sluices; or at least such portions of it as may be found to pay. These operations have heretofore so often proved failures that they have come to be left mostly to be carried on by the Chinese, who are content to work for smaller wages, or perhaps take greater chances than the whites.

The fresh placers lately brought to light, though not extensive have, in some instances, proven of importance. The portions of them found outside the main gold-producing belt of the State, are mostly situated in the Coast Range of mountains, or between that range and the sea—some of them being immediately on the beach. They are shallow and probably of no great scope, but have paid a small number of hands fair wages, and with an ample supply of water would give profitable employment to many more. Measures to furnish some of them with water have already been taken, and another season it is thought they will better reward those who may seek to work them. In consequence of the late discoveries made upon the cement and gravel ranges, so immeasurably enlarging the probable area of our placer mines, as well as the various improvements made in the methods used for reaching and manipulating the auriferous earth, and in brief, by reason of the healthful condition and encouraging aspect of the business generally, this branch of mining is beginning to enjoy the confidence of all classes, being regarded by the laboring man and capitalist alike with favor. Money is being freely embarked not only in the purchase of claims—for some of which very large prices have lately been paid, but also in the erection of mills, the construction of tunnels, ditches, and other works of a permanent and productive character, arguing for this pursuit an approaching era of much prosperity.

QUARTZ MINING.

While the situation of things in the department of placer mining is thus progressive and promising, we find the quartz mining interest of the State to be in a condition still more flourishing and satisfactory—the product of bullion from this source being rapidly on the increase—while the practical difficulties that beset the business in its earlier stages are being successfully vanquished. In fact, quartz mining in California has now about passed the trying and critical stage which every great industry is apt to encounter at the outset. It has had its day of difficulty and failure, not to say of loss and disaster; results to be imputed to an utter ignorance of the business, coupled with over-sanguine expectations and, what at this day would seem an unaccountable misapprehension of the most obvious facts on the part of those charged with its conduct. The extent to which these pioneer quartz miners were misled is well exemplified by the fact that they practically adhered to the theory that these veins would pay only near the top, and that they became impoverished as descended upon; whereas subsequent experience proves the reverse to be the rule. But not only in a want of knowledge and experience, and in the troubles inherent to the business itself, were lodged the elements of defeat in the early day; the prices of labor and material were then so much higher than at present as to almost necessarily prevent the successful working of quartz on a large scale. Machinery, imported from abroad at heavy cost, was often found after it arrived at its destination in the far interior, to be so little adapted to the uses for which it had been designed as to be wholly worthless; and in this way alone serious inconvenience and loss were occasioned, there being then no foundries in the country capable of supplying the defective part. And thus this business struggled on through the period of its early infancy, for it can hardly yet be said to have reached an adolescent stage, however it may have succeeded in forcing a recognition as a legitimate pursuit upon the best classes of business men by placing itself in the front rank of the leading industries of the world. Any one desirous of engaging in quartz mining, has now the same means for calculating results as when embarking in the most ordinary kinds of business; since it can scarcely be said to be attended with greater uncertainty or risk than merchandising, manufacturing, or even stock-raising, fruit growing and farming. The cost of erecting and outfitting a quartz mill can be computed beforehand with as much precision as the cost of a woolen factory, a tannery, or a foundry; nor is there a much greater margin required in estimating the expense of opening and working a mine than in running one of these establishments. Even the average yield of a ledge can generally be arrived at with sufficient closeness for all practical purposes after it has been opened to a point that enables the expert to judge of its peculiar features and the predominating character of the ores. From whatever point of view then we may choose to look at it quartz mining and mining seems a business, when properly conducted, as likely to prove remunerative and safe as any other open to human enterprise; an opinion that even a casual glance at the operations now going on in different parts of California will abundantly substantiate. If, in further consideration of this subject, we divide the State into three parts, consisting of a Northern, a Middle, and a Southern District, we shall be better able to understand what is being done in these several sections and how they compare with each other.

QUARTZ MINING IN THE SOUTHERN COUNTIES.

Beginning at Clear Creek, the most southerly point in the State at which the business is at present carried on, we find here a great number of ledges, many of them narrow, varying in width from one to six feet, but so far as opened give evidence of decided richness. This district, though not

settled above two years, contains a population of several thousand; has ten or twelve quartz mills now running, with a number more, some of them of large capacity, in course of erection. The number of ledges already located in that section of country exceeds 500, though but a very small proportion of these have been at all developed. Some of the quartz is extremely rich—the aggregate yield under the stamps approximating \$40 to the ton. As a general thing it is easily raised and reduced, the veins being soft and the rock little mixed with the baser metals. The facilities for working both the mines and ores are good, wood and water being in fair supply in the vicinity. This district is situated on the western declivity of the Sierra Nevada, or rather in the foot-hills of these mountains and not far from their southern extremity, where they form a junction with the Coast Range. It is in the new county of Kern, formerly a portion of Tulare, and is distant from San Francisco, by the most frequented route, 350 miles in a southeast direction. Most of the freight, however, sent to this section goes by way of Los Angeles; the cost through from San Francisco being at the rate of \$30 per ton. A great deal of money has already been invested in the mines at Clear Creek, and heavy sales continue to be made—many of them to capitalists of this city, several of whom have from the first been largely interested there. Surrounding this district are a number of others, some of them believed to contain numerous valuable ledges, a few of which have been sufficiently tested to settle that point in their favor. Near White Creek, and also at various points along Kern River—streams to the north of Clear Creek—there are a number of small quartz mills and quite a good many arastras, mostly driven by water, all of which have for several years past been doing a thrifty business, running on rock obtained from the rich but narrow quartz veins that abound in the neighborhood. At all these points new mills, generally of greater capacity than the old ones, are being put up this summer, and the prospect is that they will all make money for their owners. Coming still further north, through the counties of Tulare, Fresno and Mariposa, we find comparatively little being done at the present time in this province of mining, though the latter county at least is known to contain many valuable veins of auriferous quartz, and a few parties working on a limited scale are said to be doing moderately well, the Merced river being the locality of these more successful and active operations. The large and expensive mills erected several years since upon the Fremont estate in this county, are now standing idle, having, after many fruitless attempts made to keep them running, been obliged to finally succumb to the combined effects of divided counsels, wasteful expenditure and general bad management. A portion of the mines upon this estate are, however, thought to be good, and capable, if well directed, of profitably employing all the mills belonging to this property. Throughout the counties of Tuolumne, Calaveras, Amador, and Eldorado, constituting the MIDDLE OR CENTRAL DISTRICT OF THE STATE,

A marked degree of activity in this branch of mining is observable; the energy displayed in opening the old and prospecting for new claims being greater than ever before. The numerous and extensive mills throughout this region are nearly all running, and generally with diminished expenses and increased earnings. The number of these structures going up this season is also large, those already built being inadequate to the work of crushing the rapidly accumulating ores. Capital is going quite freely into this section, many heavy purchases of mining properties having been made within the last quarter, and a variety of enterprises involving the expenditure of large sums have meanwhile been set on foot. It is a feature of many of the ledges in this district that they carry much free gold, found in nuggets or bestowed in pockets of frequent occurrence along the course of the vein. Still the quartz here is not supposed to pay as evenly or to give as high an average yield as elsewhere in the State. The district, however, from its proximity to the great centers of mining supply, has the advantage of cheap freight, being at the same time well furnished with wood, water and the other staples essential to economy in the exploration of metallic veins and the treatment of their ores. To even enumerate all the mines of ascertained value, or make the briefest mention of the many improvements completed or going forward within the limits of these several counties, would call for more space than we have to spare. Suffice to say that many of these mines after having for years been successfully worked with arastras are now yielding more largely than ever under the potent agency of the steam engine, and that these improvements are fully equal to any found elsewhere in the State. Among the more productive and profitable mines in this quarter, the Soudby, near Sonora, and the Hayward, in Amador county, take precedence—the net earnings of the latter being from \$30,000 to \$40,000 per month. Its entire yield since 1853, when it was first opened, has been nearly \$7,000,000, and although now being worked at a point 1,300 feet beneath the surface it falls to convince signs of impoverishment or exhaustion.

THE NORTHERN DISTRICT.

comprising Placer, Yuba, Nevada, Sierra, Butte, and Plumas counties, covers what may be justly considered the balance of the quartz mining region of California, as well as the site of the earliest and most extensive operations yet undertaken in the prosecution of this business. While each of these counties contains a large number of mills and a multitude of ledges, many of them highly prolific and thoroughly developed, Nevada, considered in this connection, has from the first entitled herself to the distinction of being called the "Empire" County of the State. Here we find not only the most thoroughly explored, steady paying, and largely productive claims in the State, but at the same time the best examples of general success any where to be found in this department of mining. But as Nevada in the business of quartz mining may justly be regarded as outranking every other county in the State. So may

THE DISTRICT OF GRASS VALLEY.

be accounted the most important locality in Nevada County, since it will produce from this source the present year a sum exceeding \$5,000,000, and will before the season closes contain within its limits about thirty well appointed and in every respect first-class quartz mills, carrying in the aggregate over 300 stamps, and having a capacity for reducing nearly double that number of tons of quartz daily. The magnitude of this interest as displayed at this point will be made the more manifest if we examine, however briefly, the operations of a few of the leading companies at that place, selecting such as may fairly be considered representative mines.

ALLISON RANCH MINE.

The yield of this mine for the half year under notice has been \$40,000 per month—a total of \$240,000, more than half of which may be set down as clear profit. This was extracted from some 2,300 tons of ore, the average yield being \$104 per ton. This vein is now being worked at the depth of five hundred feet, at which point it is three feet wide, and exhibits a compact and well concentrated body of ore, not only of high grade. This company runs a 12 stamp mill, capable of crushing only about 125 tons per week.

THE NORTH STAR.

universally conceded to be a mine of extraordinary merit, and undoubtedly one of the most valuable about Grass Valley, has the further advantage of having been developed in

a thoroughly scientific and substantial manner. It is opened by a main incline 665 feet long, and having a vertical depth of 250 feet. The vein, which lies quite flat, and varies in thickness from one to six feet, averaging about two and a half, has been exposed in the lowest level some 425 feet eastward from the main shaft, and 640 feet in the same direction in the next level above, securing for it a very thorough exploration. From these lower levels very little ore has been raised, and between the bottom level and the two levels above, the length and average width of the vein being carefully ascertained by actual measurement, it is thought that 10,000 tons of ore can yet be extracted, worth \$35 per ton, and in the virgin ground, which extends to the surface above these three lower levels, and varying in length from 400 to 600 feet, it is estimated that 20,000 tons may be taken, worth say \$28 per ton. In other words, with the developments now made from the bottom of the shaft to the surface, 30,000 tons of ore still remain untouched, valued at over \$900,000. The great wealth of this mine will however probably be found in sinking still deeper, inasmuch as the lode has shown a steady improvement as descended upon. For the past five years this claim seems to have been worked with reference to the future, rather than for consideration of immediate benefit. Although dividends have been declared at irregular intervals since 1852, the real prosperity of the mine dates from 1861, and during the past four years a net profit of \$500,000 has been realized, of which sum fully \$125,000 was expended in various improvements, such as the construction of a drain tunnel half a mile in length, new hoisting and pumping apparatus, and in the erection of a new and very substantial mill, capable of crushing at least 35 tons of ore per day, leaving \$375,000 for actual dividends. All this was accomplished with a 6-stamp mill, running in 1862 and 1863, and since then by one of 9 stamps. The returns for the first five months of the present year reached nearly \$90,000, extracted from some 2,500 tons of ore. The average yield of the rock has been about \$35 per ton for several years past, that more recently crushed running up to nearly \$40. This valuable property, including the new 16-stamp mill, was not long since purchased by several capitalists of this city, for \$450,000, but it probably could now be resold for a much larger sum. The working management will remain in former hands, the whole being in charge of Mr. Wm. H. Rodda, for a long time general superintendent.

EUREKA MINE.

The gross earnings of this mine for the eight months ending May 31st, were \$284,000, their expenses having meantime been \$102,000, leaving a balance in their favor of \$182,000. During the month of June last the product of this mine was \$71,000, besides sulphurets valued at \$2,000, estimated expenses being meantime \$13,000. The average yield of the ore during that month was at the rate of \$65 per ton. The yield during the last three months of 1865, was at the rate of \$33 87 per ton, while the lot crushed during the first five months of the present year gave an average of \$42 67 per ton, showing how uniformly but very materially the ore increased in value as the mine was developed downward. The present lowest level in this mine is 300 feet beneath the surface. The cost of mining and milling this ore was about \$13 per ton, this being about the average cost at Grass Valley.

THE OREIN.

Another of the rich and promising mines of Grass Valley, though for a time under a cloud, is now enriching its owners. The claim is well opened, and the company have just finished one of the most superb mills ever erected in the State, built at a cost of \$125,000. It runs 30 stamps and has a capacity to reduce over 60 tons of rock daily. The Ione Company possess a ledge of good size and unquestionable richness, which they have lately been subjecting to a rigid exploration. The earnings of their mine, though not yet worked to any great depth, has sufficed during the past few months to pay current expenses and defray the cost of a 10 stamp mill. The Huoston Hill Company, owning a six-inch vein have been able to divide among themselves \$3,000 per month, since January last. The Noramanga, one of the mines of the Forest Spring Company, has been doing well, and at this time is probably in a more promising condition than for several years past. The aggregate production of this claim has exceeded \$1,000,000, and it is thought that regular dividends can be made hereafter, under judicious management. Active operations continue upon Osborn Hill, New York Hill, Massachusetts Hill and Union Hill, and many other claims in this locality are increasing their net earnings. The Kate Hayes mine, purchased a few months since by parties in this city, is undergoing a vigorous development, and we are informed that recent explorations are regarded with much favor.

Grouped about the above mines are many others equally entitled to notice, and all of which we would speak of in detail if our space would allow. The main facts, however, would not differ widely from those already set forth, going to show the mineral opulence of this district, and the lucrative character of quartz mining where, the conditions being favorable, it is carried on with energy and prudence; for it must not be overlooked that the business as conducted at Grass Valley has, for the most part, been in the hands of men distinguished for these qualities. They did not, as a general thing, grow impatient for mills before they knew whether they would need them or not, nor did they abandon their claims in despair if they failed to find pay rock immediately upon the surface; on the contrary, they applied themselves diligently to labor, sticking to it with a perseverance worthy of all praise until they arrived at definite results. These pioneers also had the good sense to eschew incorporated companies, thereby retaining the control of affairs in their own hands and avoiding much useless expenditure. Another good rule was that of guarding against debt, developing the mines no faster than it could be done with their own earnings, all of which resulted in benefit to the owners, and in promoting the ultimate prosperity of the miners themselves.

SILVER MINING.

The product of the silver mines of the State of Nevada for the half year just closed exceeded \$7,000,000—being at the rate of \$14,000,000 per annum. The various claims situate on the main Comstock lode are yielding their usual complement of ore, and all the mills dependent upon them for their supplies are kept constantly running, there having been fewer of them unemployed the present summer than usual. The lower levels of these mines, some of which have reached a depth of more than seven hundred feet, are nearly all now developing larger bodies of ore than were met with at the beginning of the year, affording satisfactory evidence of continued productiveness and permanency. The expenses attending the extraction and milling of these ores, although of late much less than formerly, owing to better management, is still very considerable. Less than ten per cent. of the entire yield of bullion from the Comstock lode for the first half of this year has been divided among stockholders in the shape of dividends, and a number of assessments have been levied by certain companies. During the year 1865, with an aggregate yield of nearly \$15,000,000, the dividends disbursed to shareholders amounted to \$1,900,000, and the aggregate assessments levied exceeded \$1,550,000. From the mines located at other points in the State the yield has not been large thus far the present year, many of the mills having been idle, owing,

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, July 14th, 1866.

The receipts of Treasure from different sources, during the past half year, have been as follows through public channels:

From California, Northern Mines.....	\$12,337,734
From California, Southern Mines.....	2,263,000
From Nevada.....	2,263,000
From Coastwise Ports, Oregon, etc.....	2,079,000
Imports Foreign, British Columbia, etc.....	1,345,240
Total.....	\$23,313,745

In comparison with the year 1864, there is a falling off in the total receipts of \$1,972,014, and as against last year the decrease amounts to \$3,976,998. These figures embrace coin as well as bullion. The recorded receipts of the latter amounted during the period under review to \$21,137,733, including \$7,263,000 from the silver districts of Nevada. During the first half of last year, the receipts of bullion from Nevada exceeded \$8,600,000, showing a decline of \$1,336,782 this year. From the Southern mines the decrease amounts to \$980,248, and from the Northern mines, \$2,317,030, as compared with the first six months of 1865. There has been a steady falling off in the yield of the Southern mines for several years past. The lessened productivity of the Northern mines during January and February of this year, was owing to the interruption of both quartz and placer operations by the unusual severity of the weather. Since March last the yield of the Northern portion of this State shows an important increase over a like period last year. In arriving at the probable product of the gold mines of California and the silver mines of Nevada, it would be proper to add say 10 per cent. to the bullion receipts in this city through the express companies, for receipts in private hands. This would make an aggregate yield of \$21,298,622 for California and Nevada during the past six months. Adding say 30 per cent. to the arrivals from coastwise ports, north and south, including Oregon and British Columbia, gives the sum of \$4,056,895, making the entire product of the gold and silver mines of this coast \$25,355,517 during the first half of this year. This is probably within bounds.

There is a slight abatement in the demand for money, and rates of interest are ruling a 1 @ 1 1/4 per cent. per month on Bank, with occasional transactions at 1 1/2 per cent.

The inquiry for bullion is also less active. Gold bars may be quoted at 860 @ 870. Silver is worth about 1 per cent. premium for average bars. Receipts of treasure from the interior since the date of our estimate, amounted to \$950,000, making an aggregate of nearly \$2,000,000 for the first half of the current month.

The mining share market presents no material change. Some leading shares have been well maintained this week, while others were dealt in at a decline. Advices from Nevada have been particularly meager and devoid of interest; but so far as we can learn a number of mines are looking better than for some time past, and will probably continue to earn satisfactory dividends.

Hale & Norcross is inactive, but strongly held, and trifling sales were made at \$1260 @ \$1350, closing at \$1350, bid. The aggregate receipts of bullion for the month of June were \$104,247.33 from 2,269 1/2 tons of ore—an average of \$45.92 per ton. Different portions of the mine present a flattering appearance, particularly so in the south drift from the 535-foot level, and in the 12th floor of the 700-foot level. A dividend of \$75 per foot is payable this day.

BEAUTIFUL EVENING.—Telegraphing Extraordinary.—Tuesday evening last, though moonless, was a most beautiful evening; the air was unusually clear, and the stars never shone brighter. It appeared by the telegraphic dispatches of the next morning that a similar atmospheric condition must have rested over pretty much the entire continent. At midnight the telegraphic wires of this city were in immediate connection with New York city, and worked without any difficulty through the whole circuit. The wires were also worked with extraordinary facility during the entire day. As an instance, we may note the fact that a firm in this city had occasion about noon to send a dispatch to their New York correspondents. They were not a little surprised to receive an answer in twenty minutes from the time the dispatch left this city! Twenty minutes from San Francisco to New York, and back, will do pretty well even for this fast age and people.

NEWS FROM THE NORTH.—The *British Colonist* and *Daily Chronicle*, the last of four daily papers once published in Victoria, have amalgamated their establishments. The mines at Cariboo are turning out an average amount of gold—the Aurora and Nigger claims each yielding about 100 ounces a day. The accoutre from Big Bear are very contradictory. Some miners are doing well, others returning in disgust.

as is said, in some cases to an insufficient supply, and in others to the difficulty encountered in treating the ores. Many of the lodes in these outside localities, though apparently rich, have only in a few instances been thoroughly opened—scarcely in any sufficiency to reach permanent bodies of ore; and hence the inadequate supply—many large mills having meantime been erected. With a systematic and thorough development of the mines, of which there are great numbers in these outside districts, there can be little doubt but that the mills now built, and perhaps many more, would be able to find constant and profitable employment.

COAL.

The present very considerable and the immense prospective demand for fuel in California, imparts to the question of its cheap supply, a peculiar interest, both as a matter of public and domestic economy. To us nothing is more vitally important, since in its solution are involved so many considerations bearing upon our material prosperity. Upon this we shall be mainly dependent for the generation of that motive power which is hereafter to carry on our mining and manufacturing industries, sustain our commerce, and even, to a great extent, our mechanical and agricultural pursuits, and, in short, all the great arts and interests of both war and peace. Being of such practical importance, it is not strange that this question of fuel supply should have attracted the attention of our capitalists and business men, a number of whom have lately become largely interested, as we understand, in the partially developed coal mines of Mount Diablo, and elsewhere upon this coast, with a view to pushing them, by a liberal application of capital, to such a point of productiveness as will meet and satisfactorily answer the entire home demand for coal. Should this project be carried out it would no doubt result in advantage to the consumer and in pecuniary profit to the parties concerned. In the meantime, the coal mines, both in this State and in Washington Territory, are turning out their ordinary supplies of a steadily improving quality of fuel which, recommended both by its excellence and cheapness, is growing in favor with all classes of consumers.

COFFEE.

Throughout all parts of the mineral bearing belt of this State discoveries of copper lodes are reported, some of which would appear to be of much prospective value. The Union and Koystone have, during the past six months, yielded as well as at any previous period, the former turning out at the rate of about 2,000 tons per month, and the latter considerable quantities of medium grade ores. Much work of a preparatory kind has been done in these claims of late, fitting them for more extensive operations hereafter; and as they exhibit large bodies of good ore in all their shafts and lower levels, it is expected that henceforth the quantities raised will be considerably increased. Many other lodes in the vicinity of Copperopolis are now beginning to yield, and in the course of the next half year will largely augment the shipments of ore from that vicinity.

QUICKSILVER.

In the New Almaden mine, whence 90 per cent. of all the metal produced in this State is extracted, operations are being carried on with the energy and good results that have characterized the present management. The working force employed at present is large, being not less than 1,300 men in the various departments. The company have recently much enlarged their reduction works, and it is understood have also introduced some valuable improvements in their mode of treating the ores. Active operations, after having been suspended for a number of years, have been resumed at the New Idria mine, and it is reported with encouraging prospects of future success. About 100 men are now employed in the Redington Quicksilver mine, near Clear Lake, upon which extensive furnaces have lately been erected and other improvements made—insuring for the current year, as is believed, a large product of metal. At various other points in the State deposits of cinnabar have been found, some of them of presumed value.

The following are our exports of Quicksilver for the first six months of this year, as compared with the same period of 1865.

PETROLEUM.

The production of California Petroleum is steadily increasing, and is evidently destined to become a great source of wealth to the State. The adoption of new methods of opening the claims, by tunnels rather than by boring wells, has in most cases given satisfactory results, and a steady supply of good thin oil, like that from Pennsylvania, has been obtained in several places. Regular shipments are now made from San Buenaventura to San Francisco, and one claim has furnished over 1,000 bbls, which is not one-fourth probably of what might have been saved. Preparations are making for a more active development by tunnels, which it is now believed are much more likely to cut the springs of oil than vertical borings. The localities of thin green oil resembling that of Venango County, Pa., are numerous in the Santa Anna and the Azufre mountain ranges, and several are being developed by San Francisco capitalists, with every prospect of success. Two or more refineries are now in operation in this city, producing a superior quality of illuminating and of lubricating oil from the native Petroleum. A large refinery is being erected at the Buena Vista claim, in the Tulare Valley, where there is an extensive region, giving promise of an abundant supply of oil.

BORAX.

The source of supply of this mineral is a large and shallow basin called "Borax Lake," near Clear Lake, in this State. Hitherto the company who own this property have been engaged in extracting the natural crystals of borax which are embedded in the mud of the lake, by means of small iron coffer dams. By this means, working in a very small way, they raise about 3,000 pounds of crystals per day. But they are now preparing to extract borax from the mud of the lake by lixiviation, having ascertained by experiments on a large scale, that the mud for a depth of about eight feet, after all the crystals of an appreciable size have been removed, when dried at a temperature of 150° F., contains 14 per cent. of borax and 28 per cent. carbonate of soda. This rich mud, covering an area of about two hundred acres, will afford many thousand tons of borax per annum, for a period practically unlimited; and there is every reason to suppose that the boracic acid springs at the lake will perpetually renew the supply. The company expect in the course of a few weeks to turn out between five and ten tons per day. Borax Lake is a shallow pond, which in the month of September is nearly or quite dry; and covered with an incrustation of borax, soda, and common salt, giving it the appearance of a field of snow.

SULPHUR.

On the land belonging to the Borax Company, consisting of about three thousand acres, held under a patent from the United States, there is also a very large deposit of sulphur, estimated to contain many thousand tons. The company are now producing about ten tons sulphur per diem, of quality known as brimstone.

Mining Summary.

CALIFORNIA.

Alpine County—

The *Miner* of July 7th, has these items: The American company are now pushing their drift, working six men and making twenty-six hours each day. The rock is hard quartz, sometimes requiring twenty-five drills to put down a 15-inch hole, but it looks well. Some very rich ore has been recently found, and when the furnace trial, soon expected to take place, shall prove which is the best method of working this ore, something definite will be done with it. A shaft has been sunk to the depth of fifty feet on the Poe ledge, and a cut or drift of twenty feet run, developing a vein of ore three and one-half feet in width. Dr. R. B. Ellis, of Carson City, is now building a smelting furnace, to be completed in two or three weeks. We have seen samples of this ore which assayed over \$700 per ton. The George Washington mine, which has been kept under lock and key for a few months back, is now attracting considerable attention. Mr. W. D. Root, the Secretary, has been authorized by the company to proceed to the mine and make all necessary arrangements for erecting furnaces, building mills, or otherwise placing things in working shape.

Amador County—

The *Ledger* of 7th inst., says: The Oneida mill, with its forty stamps, is now running night and day, and yielding handsomely. Many valuable improvements have been made in the machinery used for crushing and saving the gold, as well as in the mode of working the mine; and at this date everything is working well. The Kennedy mine cleaned up on Monday last, a run of one hundred and sixty tons of rock, which yielded five hundred and eleven ounces of pure gold, with a little over one thousand dollars worth of sulphurets. This rock was taken promiscuously from the mine, no attempt at selecting having been made. The rock was worked in the Coney & Bigelow mill, of this place.

The *Dispatch* of same date, says: In the vicinity of Enterprise, Aden & Co. have a shaft eight feet by six in size and eighty feet deep. The Grayhound claim has a shaft the size of the above, forty feet in depth, favorably located for working, and is yielding rock that prospects from ten to fifteen dollars per ton. We saw a nugget weighing six ounces, taken from the Jefferson, which, it is estimated, contained three ounces of pure gold. The Enterprise changed hands last week. The purchasers express the determination to erect a mill, and prosecute the work of developing the mine with vigor. The Richmond mill and mine were sold last week, we learn, and operations will soon be resumed upon the works. At Fiddletown, some very rich placer diggings have been discovered in the ranges of hills on either side of town. The Kinsmill claim, at the depth of one hundred and three feet, has four feet of cement gravel above the ledge, and prospects one dollar to the pan. The company is now engaged in erecting a whim and arastra. Mr. Peck has struck good pay gravel in the hill on the north side of the town.

Volcano correspondent of same says: The placer mines are paying well. Philbrook & Co. cleaned up \$3,000 after a run of three weeks in pay dirt. Young & Co., on the lead of Jackass, are doing equally well; also Frederick & Co. On the different flats around Volcano there are about thirty dericks working every day, hoisting pay dirt that yields a very handsome dividend.

Butte County—

The *Record*, June 30th, has these items: Work on the Silver Ledge at Cherokee is still progressing. Mr. Davis has tunneled in some sixty feet, striking the ledge at a depth of about thirty feet. Rock from this ledge has been tested both in San Francisco and in the mills at Humboldt. Both trials yielded about sixty dollars per ton.

Calaveras County—

The *Courier* of July 7th has these items: Eighty tons of quartz from the claim of Goulson & Co., near West Point, in this county, recently crushed at Smith's mill, yielded one hundred and fifty dollars to the ton. The expense of extracting, hauling and crushing the above amount of rock was only eight hundred dollars, leaving a profit of \$1,200. Five tons of unassorted rock from the Two Dollar Gulch lead, at Railroad Flat, yielded forty-five dollars to the ton. The lead is three feet wide. The Fair Play, at Downing Camp, is said to be yielding rich rock.

Correspondent of Amador *Ledger*, at Mokelumne Hill, says: New placer diggings have been discovered in some gulches and flats about twelve miles easterly from West Point, which has caused quite a rush of the mining population from this vicinity. The diggings are said to be of great richness, but their full extent has not been satisfactorily ascertained. I understand, also, that very rich quartz mines have been struck at Railroad and Skull flats, a few miles from West Point.

Nevada County—

The *Gazette* has these items: The Sherlock ledge has been stripped for a distance of about twenty feet, and found to be from one to three feet thick. Two hundred pounds of the rock yielded, by working process, two dollars and sixty cents. The hoisting works of the Curtis mine, near Grass Valley, were destroyed by fire on Saturday night. The Comanche ledge has been stripped on the surface for a distance of seventy-five feet or more, and an incline sunk about fifty feet in depth. The ledge is of good size, well defined, and the rock rich. We learn that Phelps & Adair, who have been engaged for some years in running a tunnel for their gravel claim at Phelps Hill, got through the rim rock last Saturday, and struck the richest kind of gravel. They have picked up on the bed-rock, which is the channel of an ancient stream, quite a number of forty and fifty dollar nuggets, and many smaller ones.

The Grass Valley *National* says: In the Essex ledge, an incline double shaft, six by four feet, has been driven down to a depth of 106 feet, from which a drift sixty feet in length has been run in a due westerly course. It is expected that the ledge will be obtained in a week or ten days at the most. Some very rich rock has been taken from the ledge, when it was first discovered in Wolf Creek, about a hundred feet from where the shaft is sunk. Messrs. Joseph Woodworth and Vokes have now one of the best mines in Grass Valley. We mean the old Osborn Hill. Quartz from this mine pays \$150 to the ton.

Some very rich specimens were recently taken from the Inkerman. One piece of rock, weighing perhaps twenty pounds, shows large seams of handsome gold running clear through it. The sulphurets are very rich.

The *Transcript* gives these items: A new mining district has just been discovered in this county, which bids fair to rival the famous Excelsior district in richness, if not in extent. Some eight or ten ledges, resembling very much the ledges of Excelsior, and prospecting equally well, have already been located. The district is near the Culbertson grade, and about two miles north of the Yuba river. The ledges are large and well defined. They run north and south, and may be easily traced by the croppings. A working assay has been made, and the rock yielded \$235.50 to the ton. The lead discovered in the middle of the city a few days ago will pay at least five hundred dollars to the ton. Much of the rock contains any amount of splendid looking sulphurets. We have before us now a piece of rock from the ledge, which sparkles with free gold. A few days since a rich lead was struck on the Colfax road, about two and a half miles below Grass Valley. The ledge is two feet thick upon the surface and is well defined. A piece of rock weighing two or three pounds, taken from the croppings and crushed in a mortar, showed thirty or forty colors. The rock, a short distance from the surface, contains a large quantity of rich sulphurets. The cement mills on the claims of Knowlton & Co., at Brandy Flat, near Washington, were started about ten days ago. They are getting out excellent cement, and from a partial clean-up, made on the 2d instant, they got a very fair return. The Eureka shaft is down 320 feet. The lead is seven feet wide at that depth. Fifty men are worked on a shift day and night. The sulphurets are worth \$400 per ton, and are shipped to Swansea to be worked. The result of the last run of twelve days was \$31,500.

Excelsior.—From the *Gazette*, we clip the following items: The mill of the California company, at Meadow Lake, recently made a run of twelve days, and cleaned up at the rate of fifty dollars a ton. The rock, we believe, was from the Knickerbocker ledge. On the Old Man Mountain, the two main ledges, the Mammoth and Little York, can be seen cropping out boldly for miles. This season at Meadow Lake is likely to be devoted mostly to speculation. Money will be made there by individuals, not out of the mines, but in buying and selling "feet," town lots, etc. Not until the speculative period is passed will the people go to work in earnest to develop their quartz mines.

A correspondent of the Grass Valley *National*, writing from Meadow Lake, says: The weather is now beautiful, and the warm sunny days of the past week have carried off what remained of the snow. Prospecting goes on. There is plenty of work for carpenters at six dollars per day, but work in the mines is not so plenty and other kinds of work equally hard to get. Meadow Lake is the place, although there are within a radius of five miles the towns of Mendoza, Paris, Rockland, Baltimore, Ossaville, Carlisle and Enterprise City. In the town of Pais, it is said, lots have been sold to the amount of \$8,000. The ledges in this district are invariably enased in solid rock, and require blasting from the top down, prices of contract running from fifteen to forty dollars per foot for sinking a shaft of four feet by eight.

The Meadow Lake *Sun* says: We were shown yesterday, some very rich rock taken from the Primrose claim, on the Old Woman Mountain. Some rock from the top of the Primrose ledge was worked last winter at Gold Hill which yielded \$33 to the ton. The ledge is about ten feet in width, and remarkably well defined.

Plumas County—

The Quincy *Union* of June 30th, says: Since the discovery of the rich quartz lode in French Ravine, East Branch, some of the old owners or locators are looking out for their interests. The indications are that there will be a law suit or two in regard to it. The company at work upon it are taking out very rich rock. Peel & Co.'s claims, on Grizzly Creek, have been paying well during the season. They intend putting up 2,000 feet of iron hose during the summer. A correspondent at Marion Flat, writes us that the miners in this vicinity are making active preparations for a summer's work, putting in windmills, etc., with every prospect of success. At Dutch Hill most of the claims are paying well. Zeasing & Co. are making from twelve to fifteen dollars per day to the hand. The Metropolis, on Grizzly Creek, is a copper ledge, 20 feet in width, which promises to be one of the best in the State. The ore is of that specie known as the Peacock ore. An assay made by Mr. J. Chapman, shows a yield of thirty-three per cent. of pure copper. Samuel Grass is the discoverer.

Sacramento County—

The Folsom *Telegraph* of July 7th, says: Mining in this section of the State, is decidedly looking up. Men with capital, and men without it, are prospecting, opening, and developing quartz, cement, and bank claims. Rich quartz and cement prospects are the order of the day, and numerous sales and transfers of interests are being daily made in and about the borders of Sacramento, Placer, and El Dorado counties. It is confidently believed that the celebrated "blue leads," so rich and extensive in the upper part of Nevada and Placer counties, have been struck in El Dorado county, near Placerville. We saw an assay, made by Palmer & Day, assayers in this place, from two hundred and fifty pounds of average cement, from the claims of the Western Tunnel Company, whose claim is about two miles from Placerville, from which seventeen dollars in gold was realized. The pumps connected with the Golden Rule quartz claim, situated near Horse Shoe bar, Placer county, were put in operation on yesterday. The hoisting works are on the Bonney plan, used at the Savage claim, at Virginia City. The average pay rock assays \$60 per ton in gold.

Shasta County—

The *Courier* of July 7th, says: Work in the Potosi has commenced again under the supervision of a practical mill man from Grass Valley. A run of twelve tons of rock gave \$100 per ton.

Mr. Southern showed us four "chispas," from Dog Creek, the other day, which were worth a little over \$380. Another weighed four pounds and a quarter.

Sierra County—

The Downieville *Messenger* of 5th inst., has these items: Some new and very rich gold bearing quartz ledges have been discovered between Sierra Valley and Sardine Valley. Specimens of rock show free gold in abundance. Sixty-five claims have already been located and recorded. We have been shown by C. W. Gilbert, Esq., a nice prospect taken from half a pound of rock from the Sailor claim, in which no gold was visible before crushing. Excellent rock has been discovered in Mohawk Valley, an assay of which gives \$300 to the ton. Fred. King is putting up a mill about two miles from Sulphur Spring Ranch for the purpose of working the rock. The sheds of the Bell Tunnel mining company at Greenwood, have been destroyed by fire, with their contents. Loss \$1,200.

"Gold Lake" seems after all to be a reality. A communication to the *Messenger*, in regard to Gold Lake Valley, just north of the Downieville Buttes, says: "Recent discoveries by Mr. Phil. Havens, has demonstrated that the placer fields of the valley are not only extensive, but unusually rich in auriferous deposits as well as gold bearing quartz veins. The latter have undoubtedly been the source of the placer gold found in the workings, the gold being of a light and porous character with points and surfaces not rounded by abrasion or water worn. This valley is situated in the same mineral belt as Summit City or Meadow Lake, which is now attracting so much attention. The tide of capital and emigration being on the direct road, is sure soon to flow this way. Heretofore its apparent inaccessibility (more apparent than real) has deterred the prospector and capitalist.

Tulare County—

The *Times* of June 29th, says: From our office window we have observed for the past week, an unusually number of large ox-teams pass en route for Clear Creek, Owen's River and Kelso Canon, loaded with all kinds of machinery. From the number of boilers, engines, quartz crushers, etc., we are of the

opinion that our mining neighbors have big fortunes in view.

Letter from Keyesville to the Mariposa *Free Press*, June 25th, says: The Mammoth lead, just above Keyesville, has been purchased by Messrs. Baldwin, Sanborn and Roberts, who are erecting a good substantial water power mill of twenty stamps, near the site of the old mill below the bridge on Kern river. It will be completed in about two months. At Kernville the Big Blue mill is in operation, crushing quartz from the Sherman vein. It is said to be paying well. They employ about twenty-five men. On the Greenhorn Mountain, the mill formerly owned by Marsh & Kennedy has been purchased by Messrs. Eldridge & White, together with several veins in the neighborhood. They are pushing along their work rapidly.

Yuba County—

The Brown's Valley correspondent of the Marysville *Appeal*, says: There is not a shadow of doubt, in my mind that the Pacific and Dan Webster claims are located on the Pennsylvania lode, and that when once developed and worked, will pay equally as rich as those of the Jefferson and Pennsylvania companies. The pay streaks of this lode are running at an oblique angle of about forty-five degrees, and the Pennsylvania Incline No. 1 has been sunk between two of those pay streaks, and at a distance of 200 feet from the shaft of the Jefferson company. Things look in every respect better than ever, and the next clean up will certainly prove still more satisfactory. The lode to-day is from ten to fifteen feet in thickness, and the quartz all equally rich.

NEVADA.

Washoe—

The *Enterprise* says: There are over seventy mills engaged at present reducing the ores of Storey county, the yield being 1,600 tons per day, which at the fair average of \$25 per ton, amounts to \$40,000 per day, or \$120,000 per month of thirty days, making a grand total yield of \$14,000,000 per year.

From the Gold Hill *News* we clip this item: The Petaluma mill is doing as well as ever. The eight stamps of 500 pounds each, crush from ten to twelve tons of Crown Point rock every twenty-four hours. Eighteen pans perform the amalgamating for the same.

Reese River—

The *Reveille* has the following items: A depth of over one hundred feet is reached on the Joe Douglass, with a good vein showing large quantities of iron sulphurets, with indications of silver. On the Pennsylvania and Nevada the incline has reached a depth of one hundred and thirty feet, with a ledge of about two feet in thickness, showing very rich streaks of ruby silver ore. The High Bridge, or Transylvania, in Philadelphia district, presents altogether remarkable features. A mass of mineral outcrops on the hill like a bold ridge, in an unbroken line for over a hundred feet, and around this ridge, and along the course of the ledge for upwards of a mile, lie defaced masses or boulders of float, every piece of which when broken into exhibits the most beautiful ore. A cut from the foot wall seven feet broad, and extending into the hill nine feet, has been made in the vein, and the head wall has been uncovered below the outcrop, which gives the vein the splendid proportions of twenty feet in thickness, holding in three strata fifteen feet of compact, exquisitely variegated mineral. We brought away from the district a large piece of the ore, which gave an average yield in an assay by Stetefeldt of \$1,750 per ton.

Same paper of June 28th, says: We learn from William Warner that he has just discovered and located two good ledges on Silver Hill, in the Philadelphia district. They are called the Columbia and the Great Western, and they are situated in the neighborhood of the High Bridge, the former being 150 feet from it down the hill. The Great Western ledge is represented to be from twelve to fifteen feet thick, and the Columbia ledge, which had not been cut through, is at least three feet thick. We have received samples of the ore, which appear to be of superior quality, especially that obtained from the Columbia, which is beautifully party-colored, and resembles the rich mineral of the Transylvania and El Dorado. The Great Eastern is now fairly in the field, supplying two mills—the Keystone and the Ware—with the richest of ore for reduction.

In the Astoria work is carried on night and day. The incline has reached a depth of 140 feet. The vein is fully three feet thick. Assays of picked specimens of the mineral yield handsome figures; the chloride, obtained at a depth of forty feet, gave \$649.58, and the sulphuret ore, obtained below the water level, gave the great yield of \$790 of silver per ton. The Asteroid belongs to a Philadelphia company. The developments upon the Murphy No. 2 mine, Twin River, have disclosed a fine body of ore that equals in richness anything in that locality. The Golden Fleece, at the depth of twelve feet, shows rich ore. Upwards of sixty locations have been made and recorded

in Hot Creek district. . . The amount of bullion produced by the Midus mill, from June 1st to the 24th inclusive, was \$35,253.57. Of this sum, \$23,918.42 were obtained from 70½ tons of ore from the Yankee Blade mine, belonging to the company; the ore averaging \$339.26 per ton, and the bullion being of the extraordinary fineness of 994. . . Total shipment of bullion for June from Austin, \$101,516.26. . . The Great Eastern yielded and shipped within one week \$10,417. . . In Palmetto District an incline has been sunk on the Dayton to the depth of fifteen feet, developing a handsome vein of mineral fully five feet thick. Another ledge, called the Kentucky, of mammoth proportions, gives great promise. . . A sample of red oxide of copper, from the Battle Mountain district, near the Humboldt River, exhibited native copper slightly, and yielded eighty-two per cent.; and a sample of copper glance yielded sixty-six per cent. of copper.

The following items are from the Nyc county News: The Pioneer mill, at Ione, is to be sold at Sheriff's sale on July 23d. It is nearly new. "This is one of the best offers for the investment of capital ever made in the country, and we anticipate considerable rivalry among purchasers." . . . The Knickerbocker mill, the finest in the State, without exception, according to the News, is now crushing custom ore. In a few weeks they will be ready to commence crushing ore from the Great Eastern claim, for the purchase of which the company are negotiating.

Esmeralda—

The Union of June 23d, says:—The shaft on the Golden Age & Empire Company, on Last Chance Hill, is already down nearly two hundred and fifty feet, and is being sunk at the rate of two and a half feet every twenty-four hours. . . We are informed by a gentleman just from Patzwick that the Cornucopia company are taking very rich ore out of their mine in large quantities. The Diana claim is also yielding largely. . . The shaft of the Philadelphia Co. has already reached a depth of about one hundred and twenty feet, and is progressing finely. Preparations are going on rapidly for putting up steam hoisting works.

In the Padnet district, organized in January last, the Fitzhugh ledge is the largest as well as the richest, thus far developed. It is sunk to the depth of 27 feet, at which point a large body of decomposed ore is disclosed of some four feet in thickness. A small quantity of ore was crushed at the Del Monte mill, and yielded at the rate of \$130 per ton.

Humboldt County—

Star City correspondent of the Register, June 30th, gives these items:—The Whitmore tunnel is in 450 feet. . . Work in the "American Basin" is prosecuted day and night, and with favorable indications that the ledge is near by. Small seams of quartz, containing mineral, supposed to be feeders of the ledge, are found almost daily. The tunnel is in 750 feet. . . Owing to the demoralized condition of the agent and dilapidated state of the finances, the "Yankee" has been lying idle for some time; but the business management has changed hands, and work is to be resumed.

ARIZONA.

The Miner of June 13th, says every thing is promising in that region, and gives the following items: The Pioneer mills at Wickenburg and Lynx creek have been entirely successful, and feet in the Vulture and Accidental lodes have been sold at high prices. Both these lodes show permanency and great richness. . . The mill for the Sterling lode is already on the ground, and will be ready for use by the 4th of July. The mill for the Big Bug lode, is nearly in place. . . The shaft on the Bully Bueno lode, in the Turkey Creek district, shows quantities of good ore, and, it is reported, that there is to be no further delay in the erection of the Vickroy mill. . . Colonel Wooley's water mill is nearly ready, and the Agua Fria or Goodwin district is acquiring new importance every hour. The last found lode—the Ticconderoga—is said to surpass all others in that vicinity in size and wealth. . . On Lynx creek there is unusual activity, reminding one of the first placer excitement there. The large building for the Lamson mill is enclosed, and a part of the machinery is on hand. . . The shaft on the Eureka lode is fifty feet deep. . . Preparations are making for the Coulter, Tyson and Cummings mill. . . Messrs. Shoup and Griffin are taking fine ore from the Box Elder lode. . . McCrackin and St. James are better pleased than ever with the Deadwood. . . The Pointer lode looks finely. . . Major VanBibber has gone, with a corps of men, to work upon the Golden Wreath, a very rich lode in the Big Bug, and many other lodes in that district are to be opened forthwith. . . Arastras are at work at different points on Granite creek, below the sawmill, Messrs. Noyes & Curtis are running one by water power, and crushing the ore of the Tenth Legion lode, with satisfactory results. . . Mr. Meachin will soon renew work on the Gold Hunter, in the same vicinity, and a number of lodes about Groom creek are soon to be opened.

OREGON.

The Dalles Mountaineer of June 25th, says: The news from the various mining camps still continues good. At Olive creek the mines are paying well; and the leading merchants of Canyon City have all opened branch houses in the camp.

IDAHO.

The Statesman of June 14th, says: The quartz and placer mines about Idaho City are paying well. . . There is not much doing at Rocky Bar. The mills are all idle.

The Avalanche of the 15th has the following: The New York, Enterprise, Cosmos and Jackson mills are starting up. . . The "Greenback," a Philadelphia company, will be at work in Owyhee soon. . . Messrs. Moore & Fegans cleaned up bullion during the present week to the amount of \$13,500.

A letter from Ruby City to the Yreka Union, says the Indians are daily becoming more troublesome. We quote: "The spring opened with fine prospects and times were very lively, but the infernal Indians broke out afresh and killed a great many persons besides stealing a large amount of stock. These depredations checked business, and almost entirely stopped immigration to this place. There were a number of capitalists preparing to come here for the purpose of building mills and opening mines, but when the red devils broke out, they feared to come and take the chance of loss. The consequences are that a damper is placed upon business and no chance for it to revive, until the Indians are cleaned out."

Major Marchel, with one hundred regulars, had a pitched battle with a large body of Indians, and was defeated. It is said that the savages have concentrated on the Upper Owyhee with the intention to make one grand effort to drive the whites from the country.

MONTANA.

The Post of June 23d, has the following items: There are now about twenty-five substantial companies washing gold out of the side-hills and bars on the south side of Alder gulch, opposite the city, and quite a handsome fortune is weekly carried off for division among the partners. . . Reuben Foster, of the Mesler lode, has gone to Benton to inspect the machinery for his mill at Summit. Rumor announces that it is badly damaged by water. . . The demand for labor in Alder gulch continues not only unabated, but constantly increasing. The wages are ranging from \$6 per day, upwards.

Letter to same from Park City, says: The little mill belonging to Adams, McKinstry & Co. is doing a good business crushing rock that pays from \$30 to \$35 per ton. It is the most perfect piece of machinery in the Territory, and is driven night and day. The tunnel on the Clipper, is progressing night and day; it is now about one hundred feet long. They are taking a large amount of pay rock from it, the ledge being about seven feet wide. The owners of the Lady Abbott have commenced work in earnest. . . Messrs. Herrmann & Co. are now busily engaged in putting up their mill on a most desirable site. . . The bar diggings are paying eight to ten dollars per hand, where opened. The companies now engaged in fluming the creek are in high spirits, and think they will be able to give a good report by the 4th of July. Some Californians have discovered a dry gulch, the dirt of which they think will pay for hauling about one mile, to sluice.

Blackfoot correspondent of same, June 16th, says: All is now life, bustle and activity. * * The Bar, which is next to McClellan in richness, but second to none in extent, is now yielding its thousands daily, and by day and night, strings of men can be seen shoveling the rich auriferous soil into sluice boxes. Prairie gulch and Eureka, both tributaries of Carpenter, are also rich, and many companies are at work on them; but owing to the reticence of the miners generally, it is difficult to get any correct estimate of what amount of dust is being taken out.

Helena letter, June 21st, says: "Confederate gulch, having a very deep bed rock, is totally unworked, so far as gulch claims are concerned, although during our stay prospects of one dollar to the pan were obtained upon the discovery claim. Its tributary gulches, Cement, Montana, Greenhorn, Boulder, Baker, etc., are more or less worked, but its great wealth lies in its bars, especially those of Mootuna and Last Chance, just above the city. In the latter there are five claims, paying from wages to thirty dollars a day to the hand, and a dollar and eighty cent prospect was found upon a claim just being opened while we were there. Montana bar contains eight claims, numbered cautiously with the gulch claims, and is worked hydraulically, by five companies. The claim of Smith & Burdell at No. 9, recently cleaned up \$4,000 for a ten hours' run. At Campbell & Co.'s on No. 13, \$10,000 have been recently taken out one week; and Metcalf & Judson on No. 16, are working out \$1,000 per day with thirteen men. We are requested to correct a recent statement that \$13,000 were taken out of this claim in seven days' run. The truth is sufficiently encourag-

ing without resort to exaggeration. This claim of Metcalf & Judson in many places prospects \$6.50 to the square foot, measured on the bed rock. When it is known that the claim embraces an area of forty thousand square feet, the value of this claim may be imagined. On this Montana bar, which old Californians, who are working it assert, is the richest placer mine in the world. Hydraulic mining is very extensively carried on, banks of earth twenty and thirty feet in height are easily washed away, and the golden particles contained therein allowed to lodge in the crevices of the bed rock and flumes, and in the riffles of the sluices."

A letter from Blackfoot City to the Esmeralda Union, dated June 6th, says: I have nothing very encouraging to write about this country. There are many good mining districts and rich claims, but it takes a fortune to buy into one of them. The whole country is overrun with prospectors. They have a large enough field to prospect in, and it will take years to prospect it on account of the shortness of the seasons, there being only about five months warm enough for mining. It takes a man all summer to earn enough to keep him through the winter, and all the old settlers with whom I have conversed are unanimous in declaring that they will never spend another winter here if they can help it.

A letter from Mr. James F. Russell, who is now in Montana, to his brother at Austin, advises every one of his friends about Austin, or in fact, any decent place, never to think of going to Montana. He says "it is a perfect bilk," and he "wouldn't advise a dog to come there." There was a great deal of suffering there last winter, and hundreds would have starved to death had it not been for the game captured, of which there is a great abundance. Reveille.

COLORADO.

The Journal of the 19th June has these items: There is little or nothing going on in Lake Gulch. In Russell some sluices are being put in. Mr. Ford, at the head of the gulch, is building his smelting furnace, and will finish up a 60-foot stack, containing four flues, as soon as he can get brick, two kilns of which are being put up in Russell. Mr. Ford's process contemplates the use of Blake's Crusher and Burr stones for pulverizing, two of Colom's Separators for dressing—all of these are up and have been run—a desulphurizing reverberatory, and a smelting ditto. The Moutezuma works have had steam up for a day or two. . . The Hardisty & Hussey properties in the Barrough's lode were sold the other day for over \$100,000 cash. . . Two hundred Corosh miners came in last week. . . It is said that the Narragansett company has received orders to shut down. We presume it is for the purpose of introducing smelting. . . Lyon's last shipment weighed forty-seven pounds.

Most of the mills in Trail Creek district are silent. The editor of the Journal recently made a trip to that region. He speaks mournfully of the existing state of things. But he brightens up and predicts a "good time coming," as soon as the new and improved smelting processes are introduced in place of the stamps. This will not be done until the present disgust of those who have expended money in bringing into the district machines which are not suited for the working of that class of rock is passed.

The Oro company is getting out good-looking ore. . . The Crystal is looking finely, and yielding eight dollar rock. . . McIntire will have his works in operation within two weeks. . . The Kershaw is getting out good ore in abundance.

The Denver News of June 20th says: A specimen of Emmet ore, assayed at Central City, yielded a fraction over \$7,000 per ton, in silver. The lode has a 13-inch crevice. . . Empire is filling up with new settlers. The old mills are starting up, and new ones are being built or projected. Mr. L. has abandoned the Dodge process, with which his mill was originally supplied, and is substituting that of Behr & Keith.

There is renewed activity all along the Clear Creek Valley. A great many new men are coming in and purchasing mining and mill property.

UTAH.

The Vedette, of July 5th, says:—The mining interests of Utah are advancing with astonishing rapidity. Almost every day capitalists are arriving from the East and West, en-route for Stockton, Pahrnatag and the other mining districts. Two large companies have just been formed in New York, and have machinery en route for this Territory, which is to be used in working some of the Stockton ledges.

Pahrnatag is also attracting a vast amount of capital, and the development of the different ledges is being pushed forward with great rapidity.

The Cottonwood, Bingham Cañon and Deep Creek mines are also being developed with the most favorable prospects. New mines are being discovered daily.

Trades and Manufactures.

WM. BARTLING. HENRY KIMBALL.
BARTLING & KIMBALL,
BOOK BINDERS,
Paper Rulers and Blank Book Manufacturers.
505 Clay street, (southwest cor. Sansome),
1512-3m SAN FRANCISCO.

J. DANIEL,
(SUCCESSOR TO O. COUL)
MARBLE WORKS,
No. 408 Pine st. bet. Montgomery and Kearny, San Francisco.
Monuments, Tombs, Plumber's Slabs
Etc., On hand and Manufactured to order.
Goods shipped to all parts of the State. Orders respectfully solicited. 478-3m

NATHANIEL GRAY,
General Furnishing Undertaker,
611 Sacramento St., corner of Webb, San Francisco.

Market street, between Beale and Mala,
San Francisco.
For sale, Mahogany, Spanish Cedar, and other Foreign
Woods. 2012-3m

PACIFIC POTTERY!
STONEWARE AND EARTHENWARE OF ALL DESCRIP-
tions, such as Butter Pots, Pickle Jars, Churns, Water
Jugs, Bean Pots, Flower Pots, etc., etc., from the manufac-
tury of N. CLARK, Esq., Sacramento—constantly on hand
and for sale, in quantities to suit, by J. M. PAGE,
2012 3m No. 42 Clay street, between Drumm and East.

FIRE, HYDRAULIC & SUCTION HOSE,
And Leather Belting.

M. M. COOK & SON,
861 Battery Street, San Francisco.

Are now manufacturing as above, Fire, Hydraulic and
Suction Hose, and Leather Belting, of any dimension, and
in any quantity which may be desired. Fire Hose and
Belting constantly on hand or manufactured to order. Also
Saddles and Horse Collars.
The subscribers would respectfully ask purchasers to call
and examine their stock—also testimonials of the efficiency
of their work from such as have used their hose both for fire
and mining purposes. A diploma was awarded to his as-
sistant, by the Mechanics Institute, of this city, and a silver
medal this year. 1211-1y

J. F. & H. H. SCHAFFER,
MANUFACTURERS OF AND DEALERS IN

Bedding and Furniture,
OF EVERY DESCRIPTION.

Blankets, Comforters, Sheets, Etc.,
504 and 506 Sansome street, near Clay,
San Francisco.

This establishment is now generally known to be the
CHEAPEST PLACE in the city for good Bedding. 2112-3m

ANNUAL REPORT
—OF THE—
Pacific Insurance Company.

IN COMPLIANCE WITH THE ACT OF THE LEGISLA-
ture of the State of California, entitled "An Act con-
cerning Corporations," passed April 22, 1850, the Pacific In-
surance Company of San Francisco makes the following
Annual Report:
I.—The amount of the Capital Stock of this Company is
SEVEN HUNDRED AND FIFTY THOUSAND DOLLARS. \$750,000
and paid in gold. \$750,000
II.—The amount of the Assets is ONE MILLION AND
FIFTY-ONE THOUSAND, FOUR HUNDRED AND TWENTY-
THREE DOLLARS AND THIRTY-SEVEN CENTS. \$1,514,423.37
III.—The Company has NO DEBTS.
IV.—The amount of insurance effected during the year,
and which remained in force December 31, 1855. \$12,973,949
Marine. 481,408
This Company commenced underwriting Marine Risks,
August 1, 1855.
V.—This Company insures against the following risks,
viz.: BUILDINGS, HOUSEHOLD FURNITURE, MER-
CHANDISE, RENTS, LEASEHOLDS, PERSONS IN PORT
AND THEIR CARGOES, AND OTHER PERSONAL PROP-
ERTY, AGAINST LOSS OR DAMAGE BY FIRE.
Also, ON CARGOES, TREASURES, COMMISSIONS, PROP-
ERTY, AND WAR RISKS, AND ON ALL MARINE AND IN-
LAND NAVIGATION RISKS, TO AND FROM ALL PORTS
IN THE WORLD.
VI.—This Company will take on any FIRST-CLASS RISK
not to exceed \$75,000 (the limit fixed by law), and on all
other risks will reinsure to an extent consistent with PRU-
DENCE in other RESPONSIBLE COMPANIES.
J. HUNT, President.
A. J. RALSTON, Secretary.

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the Mining and Scientific Press Patent Agency. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

San Francisco:

Saturday Morning, July 14, 1866.

CONCESSION OF LOWER CALIFORNIA.

The mail of Tuesday last brings a full report of the details of the great Colonization Scheme, recently set on foot in Lower California. It appears that the concession embraces the entire of the Peninsula of Lower California, together with the islands, bays, harbors, streams, fisheries, etc., naturally belonging thereto. The grant combines 46,800 square miles of territory.

The nature of the concession is that within five years the grantees shall introduce into the Territory at least 200 colonizing families, and shall pay over to the Mexican Government the sum of \$100,000, previous to May 10, 1866. The money has been paid. All existing Mexican and other rights are to be respected.

The concession is obtained from the Liberal Government, through M. Romero, the Mexican Minister at Washington, and the proper officers of the government of Juarez.

The proprietors named consist of thirty-seven persons, resident mainly in New York and San Francisco. Among them we notice the following names:

Jacob P. Leese, Charles D. Poston, George Wilkes, Benjamin F. Butler, Samuel Brannan, John Parrott, A. B. Forbes, S. W. Inge, Cornelius K. Garrison, Caleb Cushing, Benjamin Holladay, John Sime, Jesse Holladay, Louis McLane, William G. Fergo, Leonard W. Jerome, Joseph W. Wians.

THE WATER DITCH TAX.—The ditch owners throughout the State, are taking measures to unite in laying before Congress such facts in relation to ditch investments, as will insure a reduction of the 2½ per cent. tax now laid upon the gross receipts of sales of water. It is justly urged that no unnecessary incumbrances should be placed upon mining, inasmuch as every dollar taken out of the earth, by miners, increases the wealth of the country. We fully agree with the ditch owners in the sentiment expressed in their circular, that if the tax cannot be entirely repealed, it ought at least to be confined to the nett, rather than the gross receipts.

MINING DITCHES AND CANALS TO BE PROTECTED.—Mr. Higby, from the Committee on Mines and Mining, has reported, and the House has passed a bill granting the right of way to ditch and canal owners over public lands. It grants to every company or individual who has, in accordance with the laws of the States of California, Oregon and Nevada, or of the United States, constructed, or who may hereafter construct, canals, ditches, flumes, etc., for the conveyance of water for mining, mechanical or agricultural purposes, the right of way over the public lands so long as such canals shall be used for such purposes.

DEATH OF A NOTED ARCHITECT.—Reuben Clark, Esq., for several years architect of the State Capitol, died on the 4th in the Insane Asylum at Stockton, from softening of the brain. Deceased was an old pioneer of this State, an architect of much merit, and highly esteemed by his acquaintances. His steady application to business produced such an effect on his brain that some months since his friends thought it best to put him in the Asylum for treatment, but the best of nursing proved of no avail. Deceased leaves a wife and three children. His funeral took place in San Francisco on Saturday last.

THE NEW BILL FOR THE SALE OF THE MINES.

The great objection which has heretofore obtained with regard to the sale of the mineral lands, is the absurd idea of rectangular surveys, which has been hitherto incorporated into all the bills proposed. It has seemed impossible for members of Congress from the Eastern States to adequately comprehend the true condition of mining operations on the Pacific coast; while the unpopularity here of all propositions heretofore proposed for the sale of the mines has been such as to deter any member from the Mining States from venturing upon either the proposition or support of any measure, whatever, looking to a change in our mining policy. The unmistakable determination, however, which has recently appeared on the part of a majority in Congress to force, at all hazards, the passage of some kind of a bill for the sale of the mines, has finally induced the mining representatives themselves, to bring forward a bill which seems well calculated to accomplish the end determined upon, with the least possible detriment to mining interests. In accordance with this conclusion, Mr. Conness has introduced the bill which we published in our issue of the 30th ult.; and which passed the Senate on the 27th, very nearly or perhaps in identically the same form in which it has reached us by mail.

This bill is nothing more nor less than putting into the form of a congressional act those local laws, which a practical experience of sixteen years has induced the miners of the Pacific Slope to adopt as the "Rules and Regulations" by which they have almost unanimously agreed among themselves to be governed, in the absence of all legislative enactments. These laws have thus far been found to work admirably, with the single exception of the imperfect manner in which the boundaries of locations have been made and defined. This objection is removed by the requirement, under the proposed bill, of an accurate survey and record by plot and description, from which there can be no deviation. The only other variations are the non-requirement of any specified amount of work to perfect the title, and the disposition of the ground by the acre instead of by the foot.

With regard to the performance of labor to perfect a title, every miner knows that the rule, as at present established, is a mere farce; while a disposition of the ground by the acre instead of by the foot, is necessary in order to compel the locator to accurately define his boundaries. If he takes up his ground by the foot, and pays for it by the foot, it will be impossible for him to know himself where his claim runs, until months and perhaps years are expended in prospecting; on the contrary, in laying off his claim by the acre, it will cost but a trifle to include land enough to cover all contingencies; while the money thus appropriated will be turned at once to public benefit in paying off our national indebtedness, instead of being frittered away to no earthly purpose to any one.

The bill of Mr. Conness, so far as the mines are concerned, is confined exclusively to "veins," "containing gold, silver, copper and cinnabar." Placer mines are not included. Lead mines would not be included did they not contain silver, which all on this coast do, to a notable amount.

HOW LOCATIONS ARE TO BE MADE.

Locations can be made by individuals or associations, as is now done. The location is to be made precisely as under our present local laws, where dips and angles are considered, but not by square claims. The act provides that when a vein is occupied and improved according to the local laws of the district where it is situated, the claimant may file in the local land office a plot of the same; and that it shall thereupon be the duty of the Register of the Land Office to publish a notice of the same in the newspaper published nearest to the location of said claim, and also post the same notice in his office for a period of ninety days; after which time, if no other claimant shall appear, it shall be the further duty of the Surveyor General, upon the application of the

claimant, to survey the plot as filed, and upon the payment of \$5 per acre, to transmit the same to the general land office, for which a patent shall issue to the claimant. The surveyor must charge his mileage from the county seat of the county where the claim is located. The claim covers "the vein or rock, with all its dips, angles and variations, to any depth, although it may enter the land adjoining, which land will be sold only subject to this condition." All locations heretofore made, in accordance with local laws, can be filed and entered as above, but "no location hereafter shall exceed 300 feet in length along the vein, for each locator, with an additional claim for discovery," "with a reasonable quantity of surface for the convenient working of the same." Under this law the title, when completed, will be perfect, and jumping will be out of the question. Neither can any adverse claimant come in after the ninety days' notice has expired. The owner may develop his mine at his leisure.

The general government will call for no fee or tax, after the \$5 per acre has been paid, until, by working the mine, the owner shall derive a profit over expenses, when he will be called upon for three per cent. of said net profits. This will be a lighter burthen than the slight tax now collected upon the gross proceeds of the mines.

It will thus be perceived that the proposed law gives the miner a perfect title to his vein, allows him, by his local laws, to decide how and when a vein may be pre-empted, subject only to being confined to 300 feet in extent, and leaves him to manage his affairs about as much as he now does.

OBJECTIONS TO THE BILL.

The principal objections urged against the bill, are that it opens the door for indefinite legislation upon the mines; that it provides a policy full of machinery, which will cost both the miner and the government more than is anticipated; so much indeed, that the government will derive so very little pecuniary benefit from it that further legislation will soon be demanded; that it will open a door for taxation, by both the National and State Government, by which the miners will be loaded down with a burthen, which may render many mines that are now worked quite unproductive in the future, and finally, that under this bill, a system of monopoly may grow up, by which individuals and companies may acquire large tracts of ground, not for the purpose of mining, but for holding until they shall be increased in value by the operations of miners around them, or until a depreciation in wages and cost of living and machinery shall make them more productive than at present.

The objection urged by the Marysville Appeal against the provision which allows the miner to follow the dip of his vein under the ground of his neighbor, does not appear to be well taken; on the contrary, we look upon that as one of the most important provisions of the bill, and without which no mines can be worked effectually. Where rights have already been acquired under the "square claim" location, those rights will be respected by this bill; but no one with any experience in mining would think of perpetuating such a system.

The papers generally throughout the State and Nevada, appear to approve of the bill; and so far as we can judge, there is a general feeling favorable to its passage, as a necessity for quieting the public mind upon this vexatious question.

QUARTZ MINERS' CONVENTION.—Pursuant to public notice, the quartz miners of Placer county assembled in Convention at Auburn, on Saturday, the 30th of June last. The Convention was called for the especial purpose of adopting a uniform code of laws for the county, and a single and safe place for the record of claims. The Convention was organized by a vote of 40 yeas to 39 nays, immediately after which it was voted to adjourn sine die. It would appear from this action, that the miners of that county were averse to disturbing the present condition of things in that county, with reference to the location and holding of mining claims.

NEW BOOKS.

POEMS BY SARAH F. CARMICHAEL.—A brief selection, published by permission of the Authoress, for private circulation. San Francisco: Towne & Bacon, Publishers, 1866.

This little volume has been issued from the press of Towne & Bacon, in the best style of the typographical art, and is for sale, chiefly by subscription. It comprises a selection of twenty-seven poems, from a much larger number, which have been written by the fair young authoress, who is a resident of Salt Lake City, and we presume it is betraying no trust of friendship to state that one object for which her friends have solicited these poems for publication, is that they may thereby be enabled to raise a small fund in aid of an effort to enable this gifted child of song, to change her residence to some spot where she may be placed more in sympathy with the world around her, and where she may enjoy the advantages of books and intellectual training in the midst of the soul-expanding influences of a cultivated and liberal public sentiment. Miss Carmichel evidently possesses no ordinary genius as a poetical writer; while her songs take a wide and glorious flight; "ever loyal to truth and humanity, ever sweet and melodious as the voice of nature." The following is the opening portion of a poem entitled "The Stolen Sunbeam:"

There's a light that burns with a quenchless glow,
In the wide, deep caverns of earth below;
Like the fire that lives on the Parsee's shrine,
Is the amber torch of the lighted mine.
Burning forever, steadily bright;
Flickering never, a changeless light;
Proud and passionless, still and fair;
Burning forever without a glare;
Burning forever, so still and deep,
A quenchless flame in a dreamless sleep;
And Time's broad ocean may roll its waves
While space hath room for the centuries' graves;
It hath not billows to dim the shine
Of the wizard fog that lights the mine.

CLARKE'S NEW SCHOOL GEOGRAPHY, forming the Third Part of Bancroft's Geographical and Historical Series, by Charles Russell Clarke, A. M., Principal of the City Female Seminary, of San Francisco. San Francisco: H. H. Bancroft & Company, 1866.

Mr. Clarke has done a good thing in the aid of education on the Pacific Coast, by the preparation of his new School Geography. The chief feature of interest in the work to Californians is the large amount of space allowed to the Pacific Coast, and those countries in more immediate commercial connection with California. This portion of the work contains much material never before published. The book likewise presents other important and peculiar characteristics in its arrangement and composition. It has been the aim of the author, in its preparation, to so write, that while conveying information to the mind of the pupil, he may at the same time aid in the development of a proper and valuable mental habit—that of connecting cause and effect; of moving backwards and forwards toward the causes and results of facts learned. The end is accomplished by making it an invariable rule never to state a fact without a reference to some one of its causes or effects. The result of this method of teaching—of being incessantly asking reasons and results—is such, that after a pupil has laid aside his books, he cannot avoid constantly asking and answering himself the same class of questions; the thing becomes a habit, and this habit is one of the most useful which can attach to a thinking being.

Education is too often made to consist of a mere aggregation of unconnected facts, instead of being reduced to a clear and systematic tracing of the relation between cause and effect, as has been done by Mr. Clarke in the preparation of his new geography.

Mr. Clarke has shown by his successful efforts as a teacher, and by the able lecture delivered by him before the State Teachers' Institute, September 20, 1865, that he thoroughly understands the science of teaching. His present effort is a really valuable addition to common school literature, and is plainly the natural outgrowth of experience in his profession. The work has been received with the highest favor by all the principal teachers in this city, and has been adopted in all our Public Schools.

by a special vote of the City Board of Education. It should be found in every school, both public and private, throughout the State. The book is published in a convenient quarto form of over one hundred pages, by H. H. Bancroft & Co., of this city.

A PRACTICAL HAND BOOK FOR MINERS, METALLURGISTS AND ASSAYERS, by JAMES SILVERSMITH, author of "Metallic and Agricultural Wealth of the Pacific States," "Miners' Companion and Guide," etc.; Editor of "American Mining Index," New York; Corresponding Member of the several Scientific Associations in the Pacific States. Comprising the most recent improvements in the Disintegration, Amalgamation, Smelting and Parting of the Precious Ores containing Gold, Silver, Copper, Tin, Quicksilver, etc., etc., with a Comprehensive Digest of the Mining Laws. Profusely Illustrated. New York, 1866.

The want of such a handbook as this work purports to be has been long acknowledged in the United States; and whatever may be the shortcomings of a treatise intended to supply that want, it should receive a hearty welcome at the hands of both practical and scientific men, if it be but honest, reliable and well meant. It is by this standard that we propose to try Mr. Silversmith's book, and not by the rigid rule which should be applied to a comprehensive and thorough discussion of any one of the numerous topics of which it treats. A brief analysis of its contents will bring us most directly to the desired end. Were it not for the fact, however, that the author is less known to new comers to this coast, than to many experienced Californians, there would be no occasion for our comments.

The preface to the first edition informs us that the book is "mainly indebted to the works of Whitney, Werner, Ure, Phillips and Orton." We are naturally led to expect quotations and extracts from these eminent authors, but hardly prepared for the wholesale plagiarism which follows this plausible and candid introduction. The first chapter, comprising more than fifty pages, which treats of the "Principles of Mining," is transferred, *verbatim et literatim*, from Prof. Whitney's "Metallic Wealth of the United States," without a word of credit or a quotation mark. In one instance a sentence, which would otherwise have betrayed its origin, has been altered, so as to allude to the "Metallic Wealth," thus:

Whitney. "In that part of this work, which treats of numerous metallic wealth, treating of example will be given," etc. Silversmith. "In that part of Whitney's 'Metallic Wealth,' treating of numerous examples are given," etc.

This is the only variation from the original for fifty pages. The wood-cuts have been appropriated as well as the text; but they are reproduced so clumsily as to lose their clearness and value; what was white in Whitney appearing black in Silversmith, and *vice versa*, while the figures in every case are presented either upside down, or wrong end foremost.

To this huge appropriation from Prof. Whitney is spliced, so neatly that the joint can hardly be discovered, a page or two of other compilation, in the midst of which appears, as a monument of conscientiousness, a paragraph of a dozen lines, in quotation marks, and credited with care to Prof. Whitney. Let tyros in the noble art of larceny learn how to practice it with gentlemanly grace from this illustrious example. Having "compiled," say, a thousand dollars, out of some eminent citizen's pocket-book or till, honesty requires you, O polite burglar! to drop him a line and acknowledge your indebtedness; and, would you add a fine touch of courtesy, then join thereto a postscript, informing him that you have the honor to return herewith your check for twenty-five cents. The churlish capitalist who could, in view of such handsome treatment, object to your quiet possession of his money, or even to your setting up in business on the strength of it, would deserve, and receive, the reprobation of all intelligent men.

The editor of this *Practical Hand-Book* is not destitute of originality. We have seen in what an original, almost unoriginal, style he can appropriate the property of others; and we shall have occasion to admire new phases of his skill in that department. The chapter headed "Manual of Mining and Metallurgy," however, contains some passages which bear internal evidence that they proceeded from his own keen observation and deep reflection. The statement, for instance, that "granite rocks very seldom include silver," will send a thrill of sorrowful reflection through Central Nevada, and doubtless put a stop at once to the so-called silver mines of the granite belts of Reese River and Smoky Valley. The deluded inhabitants of that country were under the hallucination that they had already mined, reduced, melted into bars and sold about \$2,000,000 worth of silver since their worthless granite was first discovered, three years ago; but they will now see at once the impossibility of all this; and, if

they are sensible, they will devote the fortunes they have accumulated under a mistake to the purchase and distribution of the *Practical Hand-Book*, that their fatal delusion may be dissipated.

Under the head of "Metals—their Chemistry and Geology," we are told that assaying "is the determination of the quantity of metal contained in any particular ore, to discover whether it will be worth while to extract it largely, and in what manner the process is to be conducted," and that "the knowledge requisite for this is called the *docimastic art*!"

Notes of admiration but feebly express our sensations in view of this brilliant definition. In strict accordance with it, the author has collected, as so much ore, the works of Whitney, Kustel, Lamhorn, Phillips, Ure, Orton, three conflicting systems of mineralogy, and all the advertisements of all the inventors of all the new contrivances for "taking out all the metal" contained in all the ores of all the world; and having "assayed" these rich deposits, and made up his mind that it would be "worth while to extract largely," he has filled the remainder of this wonderful volume with trophies of this "docimastic art." It is of course somewhat difficult to recognize the original ore after it has passed through Silversmith's process, and there is room for the slightest possible suspicion that these scraps of metal are dress and sweepings from Silversmith's work-shop; but the "Correspondent of the several scientific associations in the Pacific States" (with none of which we have any acquaintance), would never swindle the public in that way; and we dismiss the unworthy thought. How overpowering is the display of first-class mining and metallurgical machinery which now bursts upon us! Thunderbolt crushers, revolving desulphurizers, gigantic grinders, curious concentrators, astounding amalgamators, all pictured as they will look when they once get erected and into successful operation, succeed each other with bewildering splendor. The impartial editor has treated each with equal justice, by adopting into the text whatever the inventor chose to say of his own invention. The result is quite invaluable as a "practical hand-book" to the miner, who will find, on consulting these pages, not merely the best machinery and the best process for his purpose, but a dozen different ones, each of which is the best. There is also this great additional advantage, that when he is tired of it as a *Practical Hand-Book*, he can give it to a friend as a *Practical Joke*.

We have no especial acquaintance with the author of this volume. We now recognize him only as the editor of a mining paper which seems destined to effect, among other great changes, a revolution in geographical science. At the head of this sheet is an ornamental title, the central device of which is a partial view of the globe, bearing the Pacific Ocean, bounded on the west by North America, on the south by Panama and Aspinwall, and on the east by an unknown continent, which has not yet received its permanent title at the hands of the new geographer. Perhaps it is a mining district, hereafter to be developed.

THE PATENT OFFICE is now preparing a plate for a new *vignette* with which to ornament the head of the patent warrants issued by the Department, and is to resume the printing of specifications or descriptions of inventions which accompanies each warrant upon which the patentee's right is vested. Heretofore these specifications have been attached in writing, excepting for a short time under the administration of Commissioner Holloway, when the experiment was tried of printing, which brought the office heavily into debt, and was consequently abandoned. In the issuing of all European patents, these specifications are printed, and it is evident the plan should be adopted in this country. Patentees will be enabled to obtain duplicate copies of their descriptions at a very small cost. This new arrangement goes into effect August 1st.

Commissioner Theaker issued 165 new patents for the week ending June 12th. One of these issues was to Mr. Ellicott, of this State, for a new scientific instrument, termed a photometer, for measuring light; and which is spoken of in the highest terms among scientific men at the East, whose attention has been called to the advantages of the instrument.

QUARTZ VEINS IN AMADOR.—The *Amador Ledger*, of July 7th, has an editorial on the subject of the quartz veins in that county. It calls attention to the fact that they are directly upon the great gold bearing range of the State. It deprecates the misrepresentation so commonly practised, believing that the mines can stand upon their own merits, and that they will, in good time, attract the attention of capitalists. The article closes thus: "We have the richest mines in the State, languishing because the poorest men in the State own them."

CONTRIBUTED FOR OUR CABINET.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

LIEUT. J. H. NAPIER, of Placerville, has sent us a very fine specimen from a ledge which he has recently discovered about half a mile north of the town, in what is known as Poverty Point District. The lode has been opened to the depth of about twenty feet only, where it shows a width of thirty-six inches, with a prospect of still increasing in width as they go down. It has been called the Napier ledge. Gold is found throughout the entire lode, and even into the casing. The specimen sent us shows free gold sprinkled quite freely over one entire side. The general appearance of the rock is quite promising, and will doubtless be found to contain a large amount of sulphure as soon as any considerable depth is attained.

W. BOSWORTH, President of the Golden Rule Mining Company, has placed in our cabinet a very fine specimen of quartz, from that company's mine, located two and a half miles south of Jamestown, Tuolumne county. The specimen consists of a very dark variety of quartz, interseamed with slate, and plentifully spangled with bright, yellow gold. If the company can find two or three tons of such specimens, it would make them all rich. The Third Annual Report of the Secretary will be found in another column. This exhibit there given of the company's affairs is certainly very flattering to its stockholders.

CRUDE PETROLEUM FOR TREES.—An Eastern exchange says that crude petroleum is being extensively used in Western New York for the destruction of insects on trees. It was found that the acids of refined petroleum were injurious to the trees themselves, but the crude is said to be harmless, and has the desired effect in permanently destroying the vermin.

TOWNE & BACON, Print—Stock Certificates, Assessment Receipt Books, Transfer Journals, Circulars, Hand Bills, Cards, Billheads,

And every kind of Job work that may be desired. A NEW ARTICLE OF TAGS FOR GROCERS' USE. 16v12 536 Clay street, opposite Leidenhorff.

HOLMES' PATENT

CALENDAR CLOCK!

MANUFACTURED BY THE

ITHACA CALENDAR CLOCK COMPANY,

Ithaca, N. Y., and for sale by

W. J. EGBERT, Agent,

At Joa M. SEAMAN & Co's, 621 WASHINGTON STREET, San Francisco.

THIS TIME PIECE costs but a trifle more than any other good clock, and is just the article for every well-regulated business house, office, saloon, or, in fact, any place where a handsome, perfect time-keeper is fully appreciated. The clock has two dials, the first being the same as an ordinary clock; the second has but one pointer, and shows the day of the week, the month and day of the month. It is arranged to mark the days in leap years with equal regularity. It is an eighty-day piece, and runs from year to year without change. It can be examined at the Office of the MINING AND SCIENTIFIC PRESS. 2v13p10-11

STOCK CERTIFICATES, STOCK TRANSFER JOURNALS, STOCK LEDGERS, ASSESSMENT RECEIPTS,

And all other Blanks, Blank Books, etc., required by Mining and other Corporations, kept on hand or printed to order on short notice, at moderate prices, at the office of the MINING AND SCIENTIFIC PRESS.

EXCELSIOR PUMP!

THIS DOUBLE-ACTING SUCTION AND FORCE PUMP CHALLENGES COMPETITION, for simplicity, durability and power, and will work at any depth. The pistons for Mining Pumps are packed with hemp. The valves are reached by simply removing the "knobers," thereby avoiding the trouble of raising a long column of pipe. They will raise as much water as TWICE their size of single-acting Mining Pumps, and are sold at half the price. We have never heard of the valves in this Pump being out of order. For their many superior points they are fast replacing all other Force Pumps. Reference can be given where this Pump is working with eighteen others of different patterns, and is pronounced THE BEST; also, from some of the best miners in the State who have them in use. For manufacturers, farms or domestic use, we warrant them the best and cheapest. All sizes adapted to any power or any purpose. For sale by agents throughout the State.

THE PRESS is a large, sixteen page paper, and is truly a valuable assistant to the mining interests of the Pacific Coast.—[Nye County News.]

NEW BOOKS.—The Mechanics' Institute has received from England, a box containing twenty-seven volumes of books, issued by the patent office of that country, and containing information upon various branches of manufacture and mechanics. They come as a present from Mr. George Gordon, of San Francisco, a member of the Institute, who is now traveling in Europe.

ACCORDING to a report of Dr. Hayes, State Assayer of Massachusetts, the gold mines of New Hampshire are found to yield per ton \$867 in gold; the mixed quartz, talcose slate, gozzan, pyrites, etc., yields, upon analysis, \$310.42 per ton.

OIL IN SCOTLAND.—Scotland bids fair to rival Pennsylvania in that new source of wealth, which consists in "striking ile."

Machinists and Foundries.

PALMER, KNOX & CO., Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF
MACHINERY,
STEAM ENGINES AND QUARTZ MILLS
DUNBAR'S IMPROVED
Self-Adjusting Piston Packing,
Requires no springs or screws; is always steam tight;
without excessive friction, and never
gets slack or leaky.

WHEELER & RANDALL'S
NEW GRINDER AND AMALGAMATOR
HEPBURN & PETERSON'S
AMALGAMATOR AND SEPARATOR,
Tyler's Improved Water Wheel,
Giving the greatest power, at lower cost, than any
Wheel in use. There are over 1,500 running,
giving universal satisfaction.

KNOX'S AMALGAMATORS,
WITH PALMER'S PATENT STEAM CHEST,
Superior for working either Gold or Silver Ores.
Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past eight years in quartz
mining, and being conversant with all the improvements,
either in Mining or Milling, we are prepared to furnish, at
the shortest notice, the most perfect machinery for reduc-
ing ores, or saving either gold or silver. 13v10qy-1f

PORTABLE ENGINES, OF ALL SIZES,

DONKEY PUMPS, Etc., Etc., Etc.
The attention of the parties engaged in shipping or inland
navigation is called to the

Superior Workmanship
of Mr. LOCHHEAD, who has been in the business in San
Francisco for the last fourteen years, and enjoys the repu-
tation of having built ONE HUNDRED AND SEVENTEEN
STEAM ENGINES.
Screw Propellers of all kinds, and Steam Boat Machinery
generally, made to order, and warranted to give perfect
satisfaction in every particular. 2v12-3m

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW
prepared at the shortest notice and at the most reasonable rates, to furnish all
kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps
of all kinds, Hoisting Gear, Work, Laundry Machinery, Architectural and Ornamental
Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag,
Screw and Drop Presses, Coining Machinery, File Drivers, Bark and Malt Mills, and all
kinds of Castings.
ENGINES.—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats,
Locomotives, Stationary Engines Horizontal, Upright, Oscillating and Beam, from six
to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in
use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam
Pump and Fire Engine.
BOILERS.—Locomotive, Fine, Tubular, Upright, Cylinder and Cornish, and every
variety of Boiler Work. All sizes of tubes and pipes for pumps.
PUMPS.—The Excelsior double-acting Force Pumps are manufactured by us. These
very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's Improved Tractory
Curve Pan, Zenas Wheeler's Improved flat bottom pan, Beldin's pan, Vetch's tubs,
Prater's concentrators, Waklee's pans, Beers' pan, Oerman Barrels, Arastra Gearing, Chile
Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold,
Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Bat-
teries, or machines with the latest improvements, every variety of Stamps, Mortars, Oams,
Pans and Tubs. BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

OIL BORING TOOLS AND MACHINERY.—Of the latest and most ap-
proved construction, made from drawings lately made by Prof. Blake at the oil wells in
Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to
test their value, by the hundred weight or ton.
Russia Iron Screws, of all degrees of thickness and of all qualities of Iron. All work done
in the best manner at the lowest cash prices.

Familiar Science.

WHY DOES WATER EXTINGUISH A FIRE?—For two reasons: First, because the conversion of water into steam drives off the heat of the burning fuel; and second, because the water forms a coating over the fuel, which keeps it from the oxygen of the atmosphere. A little water makes a fire fiercer; while a larger quantity puts it out. The reason of this may be explained as follows: Water is composed of oxygen and hydrogen; when, therefore, there is only a little water thrown upon a fire the water is decomposed into its simple elements, the hydrogen burning with a flame, and the liberated oxygen aiding the oxygen of the atmosphere in giving intensity to that flame. Hence, when a house is well on fire a little water thrown upon it is worse than none. It is of no use to put water on a fire unless you put on enough to thoroughly quench it. A stream of water from a fire engine, thrown into the midst of a large fire, only adds to its intensity. A skillful fireman knows this, and attacks the fire at one edge or extremity, and advances toward the heat of the conflagration only so fast as he has thoroughly extinguished the flames in the portion which he attacks. The water must be thrown so rapidly and abundantly that the fire cannot decompose it.

WHY CAN YOU NOT LIGHT A PAPER IN A LAMP CHIMNEY?—If a piece of paper be laid flat on a surface of burning coals, not in a blaze, the paper will not light, but char. The reason for this is, because the carbon of the coal is composed of nites with the oxygen of the air and forms carbonic acid gas, which immediately surrounds the paper, keeping away the oxygen, so that it cannot blaze. If you blow upon the paper with sufficient force to drive off the carbonic acid gas, the paper will immediately blaze.

In burning a coal oil lamp, two products are formed—water, which passes off through the chimney in the shape of invisible steam as fast as it is formed, and carbonic acid gas, both of which refuse to burn except at a greater heat than is formed in the lamp chimney. Now, when you thrust a piece of paper down a chimney, or hold it over the top, it is enveloped in an atmosphere of steam and carbonic acid gas, in which it cannot blaze at the heat generated, although it is hot enough to gradually convert it into coal.

CURIOUS EFFECTS OF OIL UPON THE SURFACE OF WATER.—Tie a piece of string around a tumbler; then secure to this two other pieces of string, one to each side of the tumbler, so that they may be made to meet above it, in a knot, at about a foot distance from the top of the tumbler. Then putting as much water as will fill about one-third part of the tumbler, lift it up by the knot, and swing it to and fro in the air; the water will keep its place as steadily in the glass as if it were ice. But pour gently in upon the water about as much oil, and then again swing it in the air as before, the tranquillity before possessed by the water will be transferred to the surface of the oil, and the water under it will be violently agitated.

ANOTHER CURIOUS EXPERIMENT WITH OIL AND WATER.—Drop a small quantity of oil into water agitated by the wind; it will immediately spread itself with surprising swiftness upon the surface, and the oil, though scarcely more than a teaspoonful, will produce an instant calm over a space several yards square. It should be done on the windward side of the pond or river, and you will observe it extend to the size of nearly half an acre, making it appear as smooth as a looking-glass. One remarkable circumstance in this experiment is the sudden, wide, and forcible spreading of a drop of oil on the surface of the water; for if a drop of oil be put upon a highly-polished marble table, or a looking-glass laid horizontally, the drop remains in its place, spreading but very little; but when dropped on water, it spreads instantly many feet round, becoming so thin as to produce the prismatic colors for a considerable space, and beyond them, so much thinner as to be invisible, except in its effect in smoothing the waves at a much greater distance. It seems as if a repulsion of its particles took place as soon as it touched the water, and so strong as to act on other bodies swimming on the surface, as straw, leaves, chips, etc., forcing them to recede every way from the drop, as from a centre, leaving a large clear space.

AN AGREEABLE EXPERIMENT may be made by procuring a basin of milk-water, into which may be thrown half a dozen pieces of camphor about the size of a pea; they will soon begin to move, and acquire a rotary and progressive motion, which will continue for a considerable time. If now one drop of oil of turpentine, or sweet oil, or gin, be let fall upon the water, the pieces of camphor will dart away, and be deprived of their motion and vivacity. Little pieces of cork, that have been soaked in ether, act much in the same way as camphor when thrown upon water. Camphor, being highly combustible, will burn if ignited while floating upon water, producing a singular effect.

THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequalled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Eyerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully solicited.

Eyes! Eyes! Eyes!!!

DR. HENLY, Oculist and Aurist, HAS received from Scotland one of the most successful REMEDIES for the benefit of the HUMAN EYE ever before discovered. It is unparalleled in its effects upon the diseases incident to this organ.

It gives wonderful power to the optic nerve, and removes all the granulations from the lids, and all morbid humors from the sclerotic coat without the use of instruments. In fact, it works like a charm on the Eye, without giving any pain.

You feel the effect of the medicine in different parts of the head. It drives the disease back into the system, which is better able to stand it than this tender organ.

Why will you suffer when you can be cured in a few days. Persons who have been blind for ten years have been restored to their sight in a short time by the use of this medicine. I will treat any person's eyes in the State, and if I do not give them relief in a short time I will give them a trial.

THEY ARE ALL HERE. Office, No. 751 CLAY STREET, opposite the Plaza, San Francisco. 22v12

Rheumatism!!

READ IT! READ IT!!

SACRAMENTO, April 16th 1866. H. BOWMAN—DEAR SIR: THIS IS THE FIRST WRIT- I have done in two years, and it affords me great pleasure to be able to use my pen in the service of those who are suffering, as I have suffered, by stating the following facts.

I have for two years and upwards been afflicted with CHRONIC RHEUMATISM, and until a few weeks ago I have never found anything that afforded me any relief. For three months of the time I was unable to feed myself, and for the last five months my arms have been so bent that I have not been able to dress myself. I was five months at the Warm Springs, at San Luis Obispo, and three months at a Hydropathic Institute in Stockton, where I have been under the care of six different physicians, in the vain hope of relief.

About four weeks ago I was induced by a person who had been cured by it to try a bottle of RICHARD'S REMEDY FOR RHEUMATISM, and in less than twelve hours I experienced great relief. In a few days I was enabled to straighten out my arms, and I have been getting better and gaining in strength and flesh ever since. I have now the complete use of all my limbs, and for the first time in two years, I am out of pain. I do feel for those who suffer as I have suffered, and if they will take my advice, they will lose no time in giving the REMEDY a trial.

Yours truly, GEORGE TAYLOR.

RICHARD'S REMEDY is for sale by H. BOWMAN, Druggist, Sacramento. 15v12

Price, \$2.50 per Bottle.

Mechanical Drawings.

Persons wishing Mechanical Drawings can obtain the services of competent draughtsmen, by applying to this office. 16v12

THE DIAMOND.—Some remarkable physical characteristics with regard to the stability of color in the diamond have recently been brought to the notice of the scientific world by Mr. Fremy, of the Academy of Sciences at Paris. The particular diamond upon which that gentleman experimented, weighs about sixty grains, and, at ordinary temperature, is of a slightly yellow color. When, however, it is submitted to the action of an elevated temperature, it acquires a rose tint, which it preserves for several days, resuming gradually its normal yellow tint. The ordinary price of a diamond of this weight would be about 60,000 francs; with the rose color, if this were permanent, the value would be, at least, tripled. This peculiar change having been observed, it may be quite legitimate to ascertain if any other diamonds possess this peculiarity of change of color.

With regard to the origin of the diamond, Herr Goeppert, contrary to the usual opinion, that the diamond has been produced by the action of intense heat on carbon, asserts that it owes its origin to aqueous agency. His argument is based upon the fact that the diamond becomes black when exposed to a very high temperature. He considers that its Neptunian origin is proved by the fact that it has often on the surface impressions of grains of sand, and sometimes of crystals, showing that it has once been soft.

PUBLIC SCHOOLS IN NEW JERSEY.—New Jersey may be "slow" in some things, but she is certainly up and doing in the matter of public schools. The city of Newark, in that State, with a population of 90,000, has 43 public schools, with 11,945 registered pupils. San Francisco, with a population of 120,000, has but 33 public schools, with 9,500 pupils. Some allowance, however, must be made for the difference in the character of the population in the two cities. San Francisco is a commercial city; and containing, relatively, a less number of families. In proportion to the population, than probably any other important city in the Union; while Newark is essentially a manufacturing city, where families and their numerous children generally congregate.

TO SAVE BARKED APPLE TREES.—If your trees are barked quite around their trunks, they may yet be saved by the following process:

Cut sprouts from a thrifty tree, and connect them to the upper and lower bark, as you would insert grafts, and the trees will be sustained, by these connections, till new bark can be formed. A dozen or more of the sprouts should be used to a tree six inches in diameter. If there be a small portion of the bark left in the girdle, the tree can be easily saved, by applying a plaster of cow manure to the wound, secured by a bandage.

A BISMUTH mine has been opened in South America, two thirds up the highest peak of the Andes—the Iljamper mountain. It is 15,000 feet above the level of the sea, and just below the line of perpetual snow.

Pacific Mail Steamship Co's THROUGH LINE TO NEW YORK, Carrying the United States Mail.

LEAVE POLSON STREET WHARF, AT 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the 10th, 18th and 30th of each month that has 30 days.

On the 10th, 19th and 30th of each month that has 31 days.

When the 10th, 19th and 30th fall on Sunday, they will leave on Saturday preceding; when the 18th falls on Sunday, they will leave on Monday following.

Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.

Departures of 15th or 19th connect with French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America.

Departure of 10th connects with English steamer for Southampton, and P. & E. Co.'s steamer for Central America.

Departure of the 30th connects with English steamer for Panama, the port of the new mines.

The following Steamships will be dispatched on dates as given below:

July 19th—GOLDEN AGE.....Capt. Wm. F. Lapidge, Connecting with NEW YORK, Capt. Bradbury.

July 30th—CONSTITUTION.....Capt. E. S. Farnsworth, Connecting with ARIZONA, Capt. Maury.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

For Merchandise and Freight apply to Messrs. WELLS, FARGO & CO.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

EXTENSIONS OR REISSUES OF PATENTS

Already granted; will act as an Attorney in presenting Applications at the Patent Office, and in managing them to a final issue; will draw up Assignments; will examine into the condition of Rejected Applications when desired to do so, and undertake the prosecution of such as may be considered patentable, and do whatever else is usually done by Patent Solicitors.

Address, P. O. Box 257, Washington, D.C. 71213m

New Mining Advertisements.

Cortez Gold and Silver Mining Company.
Location of Works: Cortez District, Lander County, State of Nevada.

Notice is hereby given, that the Annual Meeting of the Stockholders of the above-named Company, will be held on FRIDAY, the tenth day of August next, 1886, at 3 o'clock P. M., at the office of the Company, for the election of Trustees to serve the ensuing year, and for the transaction of other business.

R. N. VAN BRUNT, Secretary.
Office, No. 331 Montgomery street, San Francisco, Cal. San Francisco, July 9th, 1886. jyl4

Eagle Quartz Mining Company.—Location of Works: Amador County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eleventh (11th) day of July, 1886, an assessment of one (1) dollar per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at the office of the Company, No. 10 Exchange Building (113 Montgomery street), San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the eleventh (11th) day of August, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the fifth day of September, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN M. BERNETT, Secretary.
Office, No. 10 Exchange Building, San Francisco, California. jyl4

Nonpareil Gold Mining Company, Deer Flat, Tuolumne County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the ninth (9th) day of June, 1886, the several amounts set opposite the names of the respective shareholders, as follows:

Names. No. Certificates. No. Shares. Amount.

THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; a, Dies; c, Shoes, and o, Openings.

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan when properly constructed, are respectively 177, 118 and 132.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan one hundred and eighteen tons, and the Conical Pan one hundred and thirty-two tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes direct from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been furnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have been constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the

PACIFIC FOUNDRY, San Francisco.

IRON!

Glasgow Iron and Metal

IMPORTING COMPANY,

COLVIN'S American Cow Milker.

A FEW SAMPLES of this novel and useful invention have arrived by the last steamer and are now offered for sale by an agent in this city. It was illustrated and described in the MINING AND SCIENTIFIC PRESS of May 12. The actual operation of the milker has already been demonstrated in this State. The machine may be seen at this office, where further information can be gained. 2v12 June 20th, 1886.

The Hansbrow Pumps ARE WARRANTED THE BEST.

FIFTEEN KINDS AND SIZES, Adapted for FARM, Mill and Mining Purposes.

Fitted for HAND, WIND, HORSE, WATER AND STEAM POWER. For sale in every city and town on the Pacific Coast.

LOCKE & MONTAGUE, Agents, 112 and 114 Battery Street, San Francisco. Send for Illustrated Catalogue. 23v12-2m

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the Mining and Scientific Press Patent Agency. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

BAUX & GUIOD'S Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1884, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine Scientific Knowledge with Practical Experience, these pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as separators, in addition to the ordinary Amalgamators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jeffersonian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Grail's Gravel Cement Works, Nevada county; Waltham's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe. Manufactured at the Valencia Iron Works and San Francisco Foundry, San Francisco, and at Hough & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX, 4v8-6d

THE SAN FRANCISCO BOOT AND SHOE NAILING MACHINE.

THIS MACHINE MAY NOW BE SEEN IN DAILY OPERATION at the corner of Stockton and O'Farrell streets, where the inventor may be seen and consulted at all hours.

He is especially anxious that Boot and Shoemakers, Mechanics generally, and all persons interested in the success of California inventions and California manufactures, should call and examine this specimen of California ingenuity.

The proprietor is making arrangements for their manufacture in this city, and he is now ready to contract to furnish the machine to such parties as may be desirous to purchase the same.

San Francisco, June 22d, 1886.

E. T. BARLOW, 25v12

LEFFEL'S American Double Turbine

THIS WHEEL, WHICH HAS HAD THE most unprecedented sale of any water-wheel ever made, and which has given unusual satisfaction whenever used, is now for sale by KNAPP & GRANT, 310 Washington street, San Francisco, where persons desiring to use water-power can be supplied. These wheels are adapted to use from 10 to 5,000 inches of water, and from 4 feet to 500 feet fall. Let us know how much water you have either in miner's inches or cubic feet per minute, what fall you have, and what power you require. Write or send for circular to

KNAPP & GRANT, San Francisco.

Leffel's Lever Jacks,

For railroads, cars, or wagons; Railroad Jacks for engines and cars; Track Jacks for leveling, with which three men, with a pair of these Jacks, can level more track in a day than twelve men working in the ordinary manner; also, Track Jacks for relieving the axle of pressure to replace the brass. These Jacks are now in general use in the Eastern States, and give entire satisfaction. Also, Wagon and Track Jacks of the most superior make and kind. For sale by

KNAPP & GRANT, San Francisco.

To Ditchmen, Millmen and Others Requiring IRON PIPE.

M. R. ROSE, CORNER OF 9TH AND K STREETS, M. Sacramento City, has facilities unsurpassed on this coast for the manufacture of IRON PIPE of every description. He also has on hand a deep well FORCE PUMP, of his own invention and manufacture, well adapted for oil wells. His tools being portable, pipe can be manufactured on the ground. 19v12

BLAKE'S QUARTZ BREAKER

Is now extensively used for breaking hard masses of Quartz or Ores

To a size suitable for stamps. These machines are patented, and are in practical operation in

CALIFORNIA, WASHOE, AUSTRALIA,

ENGLAND, —AND— FRANCE,

THE ATLANTIC STATES.

These Machines, or circulars containing further information regarding them, may be obtained of the undersigned. Address,

BLAKE & TYLER,

Box 207 San Francisco Post Office. CHAS. T. BLAKE, E. TYLER, Idaho City, Michigan Bluff, W. M. P. BLAKE, San Francisco. 4v10

Union Amalgamator.

This Valuable Invention

IS FAST FINDING ITS WAY INTO GENERAL USE, NOT by means of combination of capital and influence, but on the strength of its own merits, and upon the principle that what is known to be good will be appreciated. Practical men acknowledge the UNION PAN to be scientific, the best, the cheapest, and most profitable. It now stands first on the list of all pans in use for the purpose of

Working Gold and Silver Ores.

It has been found that a low class of ores, also tailings from Mills, Sulphurets, etc., that will not pay to work with the common pans, may be worked with this and obtain large profits. The UNION PAN is manufactured in two sizes, and capable of operating upon large quantities of ore in the most efficient manner.

Parties interested in Quartz Mining, Mills, etc., will find it to their advantage to call and examine for themselves, and see its operation.

Gold and silver ores tested by regular mill process, at moderate cost, by

STRONG & CO.,

San Francisco Foundry, corner Mission and Fremont streets, where orders will receive prompt attention. 15v12-3m

BRUCKNER'S

Mechanical Roasting Furnace

AWARDED A

PREMIUM SILVER MEDAL

—BY THE—

The Mechanics' Institute.

THESE FURNACES ARE NOW MANUFACTURED AFTER an improved mode of construction, which GREATLY SIMPLIFIES THEIR OPERATION,

and afford a much larger oxidizing surface to the action of heat and atmosphere.

The weight of a Furnace nine feet long by four feet in diameter does not exceed one ton.

THE IMPROVED FURNACE

will soon be more fully described and illustrated in the columns of the MINING AND SCIENTIFIC PRESS.

Parties wishing to erect such Furnaces, are requested to leave their orders with

T. KALLENBERG,

416 Market street, San Francisco.

FLORENCE SEWING MACHINES!

COPY OF THE REPORT OF THE COMMITTEE OF AWARDS AT THE FAIR OF THE

AMERICAN INSTITUTE,

New York, 1865,

—TO THE—

Florence Sewing Machine Company,

FOR THE BEST FAMILY SEWING MACHINE.

HIGHEST PREMIUM—GOLD MEDAL!

REASONS:

- 1st.—Its simplicity and great range of work.
- 2d.—The Reversible Feed Motion.
- 3d.—The perfect finish and substantial manner in which the machine is made.
- 4th.—The rapidity of its working and the quality of the work done.
- 5th.—The Self-adjusting Tension.

The "FLORENCE" was awarded the First and Highest Premium at the State Fair of California, the only Fair on the Pacific Coast at which any two double-thread Sewing Machines were exhibited in competition in 1865.

The "FLORENCE" received the only premium awarded by the Mechanics' Institute of San Francisco, in 1864 and 1865, to any Sewing Machine, Sewing Machine Company, or Agent. The claim of a competitor to a medal is without any foundation whatever.

Wherever the "FLORENCE" has been brought in competition with other Sewing Machines, it has always been declared the best. It is the most simple, the most substantial, the most efficient, and its use is easily learned. Every Machine sold is guaranteed in the full sense of the word.

Send for Circulars and Samples of Work.

SAMUEL HILL, General Agent, 20v12-14w 111 Montgomery street, San Francisco.

Rubber Belting, WITH COTTON FILLING.

A FULL ASSORTMENT OF 3 AND 4-PLY, NOW IN store and for sale by

THOMAS H. SELBY & CO., Nos. 116 and 118 California street

Pacific Forge Company.

FORGING AND IRON WORK.

THE PACIFIC FORGE COMPANY HAVE JUST ERECTED, in this city, on Front street, near the machine shop of the San Jose Railroad, a large establishment for the purpose of forging and working in wrought iron. Our hammer is the largest upon this coast, and we are prepared to manufacture, at short notice, all kinds of heavy forgings, car axles, shafts, steamboat cranks, piston-rods, wagon axles, and other similar work. This is the first general shop of the kind erected in this State, and we solicit the patronage of the public. All orders executed at reasonable rates, and with promptness and satisfaction. 19v12-3m

UNDYING PLANTS.—A letter from Guaymas, Sonora, Mexico, says: "Passing on beyond Aricheh about two miles south, we struck the bed of a stream through which we commenced our progress to another range of mountains whose slopes came down to the very edge of the channel-way. It was here that we found the north sides of rocks which face the stream covered with what at first seemed to be the most exquisitely beautiful green mosses that ever decked the rugged sides of a mountain. The entire sides of the mountain at this spot were blooming in the liveliest green. We dismounted to pluck some of these plants, and found they were not strictly mosses, though undoubtedly they belong to that class of plants. Each one had separate roots firmly holding it to the rocks, and from these roots grew out a plant that opened to the diameter of a common teacup or a saucer, and spread itself that on the face of the rock. The leaf somewhat resembles in texture the *arbor vite*. These plants bear the name of '*siempre viva*'—always living, or always alive. Their peculiarity is to come out into beautiful green life in the rainy season; and then, when all moisture has deserted them, to turn as brown as autumn leaves, and roll or curl themselves up like a ball, as uninteresting to see as a brown stone, seemingly dead. But with the return of moisture, they uncurl their leaves and spread out again as beautiful and green as ever. Another peculiarity of the plant is that you may pluck it, throw it into your saddle-bags, and keep it six months; and then place the roots in a cup or saucer of water when you retire for the night, and, in the morning, you will find by your side a lively green plant. It looks like magic. But I have tried it to my surprise and delight. The plant never dies; its life is immortal, and its beauty of texture and form and color is renewed or continues with the continued supply of moisture."

GLASS.—The first attempt to manufacture glass in America, was made at Jamestown, Virginia, and was interrupted by the Indian massacre, in 1622. The first successful factory was erected in the town of Temple, N. H., in 1780, by Mr. Robert Hewes, of Boston, Mass. The works were destroyed by fire in the winter of 1780-81, through the carelessness of a drunken furnace-man. In 1800, an unsuccessful attempt was made to manufacture glass in Boston. In 1803, a German named Lint took charge of the Boston works. He succeeded well, being encouraged by the State; and since then this branch of industry has been largely engaged in throughout the country.

A PENNYWEIGHT.—"Twenty-four grains make one pennyweight," says the Troy weight table. This was the weight of the silver penny of the reign of Edward I., and it has ever since remained one of the units of weight for precious metals.

J. B. COX, BUSINESS AGENCY.—Makes private sales of Property and Business Places of every description, in the city and throughout the State; procures partners with large and small amounts of money; negotiates sales of mining property, and does a General Agency Business. Patronage solicited by mail, express, or by personal application at the office, 402 Montgomery Street, San Francisco, California. 23-1111

VARNEY'S CONCENTRATOR,

With a disk 4 1-2 feet in diameter—total weight of Machine 350 pounds.

Is driven by one-eighth of a horse-power, and will concentrate eight tons of ore per day, and make the sulphur clean. Larger ones do work in proportion to size.

IT CAN BE SEEN IN OPERATION AT THE PACIFIC IRON WORKS, SAN FRANCISCO. 22-12-3m

REMINGTON'S ARMY AND NAVY REVOLVER,

THE REMINGTON REVOLVER

Has been approved by the United States Board of Ordnance, and has so satisfactorily met the requirements of the Government, not only in the field, but in the official tests and examinations made by prominent officers of the Ordnance Department, that it stands at once the most popular, serviceable and approved arm of the kind in use. Upwards of 125,000 have been supplied to the Government within the past four years, for the land and naval service, furnishing ample evidence of the estimation in which the arms are held.

Simple and symmetrical in its entire construction, securely strong, of most modern improvement in mechanism and material; its unequalled range and penetration, together with its durability, are points in its favor now well known, and which challenge a comparison with any other pistol of the kind made in this country or in Europe.

The superior strength and capacity of the arm for constant and long use is apparent from the fact that the entire frame is constructed of a single piece of metal, thus preventing the extension of some portions of the frame, from the effect of firing—a serious defect in many pistols—in which the frame is composed of two or more parts.

The frame of the Remington Revolver furnishes a rest for the barrel or support above the cylinder, to protect the base pin (on which the cylinder revolves) from any undue strain to which it would otherwise be subjected, and which would immediately render the fire from the cylinder to the barrel imperfect, thus destroying force and accuracy.

Another advantageous feature of the arm is the means afforded for the instantaneous removal of the cylinder from the frame. This not only facilitates the cleaning of the pistol, but by the quick adjustment of the cylinder, one pistol can be made as effective as two—and, considering the difference of weight, it is far preferable—by simply possessing a spare cylinder loaded and capped to instantly replace the exhausted one.

The above is a general summary of the points of peculiar merit in the Remington Revolver which a trial of the arm is only needed to attest. For sale at Manufacturers' rates, by

ONE HUNDRED DOLLARS REWARD!

The above Reward will be paid to any one who will produce evidence of a failure of any of HENDY'S IMPROVED SELF-DISCHARGING CONCENTRATORS, Patented February 27th, and April 17th, 1866—which said amount is deposited for 60 days with Palmer, Knox & Co., No. 19 First street, San Francisco. Send for a circular containing a description of the machine. June 23d, 1866.

J. HENDY, Patentee, No. 412 Montgomery St., Room 3, 4th Floor, S. F.

Hendy's Improved Patent Self-Discharging Sulphurets PRATER CONCENTRATOR Is Receiving Universal Favor.

Reference is made to the following Mills which have them now in use:

BENTON MILL, Bear Valley, Mariposa County.
LOUISIANA MILL, near Coulterville, Mariposa County.
OPHIR MILL, near Newcastle, Placer County.
C. H. SCHNABEL'S MILL, Doty Flat, Placer County.
CONY MILL, Jackson, Amador County.
SPRING HILL MILL, Amador, Amador County.
GOLDEN GATE MILL, Volcano, Amador County.
RAWHIDE MILL, Jamestown, Tuolumne County.
TRIUNFO G. & S. M. CO., Lower California, Mexico.

And in use in other parts of this State; also in Idaho, Arizona, Colorado and Mexico. As a further evidence of its worth, orders have been received recently from the proprietors of the following mills, all of whom are using these Concentrators, or have works in the immediate neighborhood of mills using them, viz.: One Concentrator for the Ophir G. & S. M. Co., near Newcastle, Placer County, ordered by Wells & Foster, who are using two Concentrators; one Concentrator for the Benton Mill, Mariposa County, ordered by Messrs. Dodge & Bro., of this city, who are using seven of them in the same mill; one Concentrator, ordered by Messrs. Biscow & Bro., of this city, for the Cony Mill, Jackson, Amador County, where they have already three of them in operation. They may be seen in operation at the GOLDEN STATE FOUNDRY, No. 19 First Street, San Francisco.

For explanation of the above engraving, and other particulars, send for a Circular.

Manufacturer of Brass, Zinc, and Anti-Friction or

Babbet Metal Castings;

CHURCH AND STEAMBOAT

BELLS,

TAYLOR AND HAND BELLS AND GONGS,

FIRE ENGINES, FORCE AND LIFT PUMPS,

Steam, Liquor, Soda Oil, Water and Flange Cocks, and Valves of all descriptions, made and repaired. Hose and all other joints, Spelter, Solder, and Copper Rivets, &c. Gauge Cocks, Cylinder Cocks, Oil Globes, Steam Whistles, &c.

HYDRAULIC PIPES AND NOZZLES

For Mining purposes, Iron Steam Pipe furnished with Fit tings, &c. Coupling Joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal."

Highest Market price paid for OLD BELLS, COPPER AND BRASS. 61f

Preparing for Publication.

A complete History and Directory of the

Central Mines of Colorado.

Add the towns and cities in their vicinity.

PERCEIVING THE GREAT ADVANTAGE TO COLORADO a pamphlet, historical and descriptive of its central and most important mines would be at the present time, the subscriber has undertaken to publish such a work.

It is designed to fix for the future the discovery and early history of the mines, to sketch their progress and present condition, to give such statistics as are attainable with regard to their production, actual and possible; in fine, to disseminate throughout the East and in Europe accurate information respecting them. To relieve the tedium of such a work, interesting incidents illustrating the early manners and customs of the pioneers, and the gradual organizing into its present consistence of the first, and always to be the eminently Rocky Mountain State, will be given.

It is also designed to contain a complete Directory of the towns of Central, Black Hawk, Nevada, Golden City, Idaho, Empire, Georgetown, Gold Dirt, and South Boulder; views of each of those places; separate views of the principal buildings, public and private; also views of mills and mines and of mountain scenery.

There will also be attached a Business Department, in which a limited number of advertisements will be inserted.

O. J. Hollister, of the Black Hawk Mining Journal, has been engaged to compile the body of the work—the historical and descriptive narrative. Having been here uninterruptedly for the past six years, and mingled freely in perhaps every walk of life, he trusts he will be able to do the subject ample justice.

All old residents of this region who are familiar with the discovery and early history of the mines, or with interesting incidents of that indefinite time known as the "early day," will confer a favor on the subscriber by furnishing such information to O. J. Hollister, Journal office, Black Hawk, Colorado.

The work will be issued sometime during the month of August. Price \$2, bound in paper; in muslin, \$2.50.

Address,

G. M. BUCKLEY.

May 10th, 1866.

MOTT'S DOUBLE-REVERSIBLE PLOW.

We herewith present our readers with an illustration of a side-hill or double reversible plow, invented by Mr. John Mott, of Danville, Contra Costa county, which, we think, is destined to take place in the front rank of California inventions, and one which is designed to supersede the old side-hill or swivel plow.

Referring to the engraving, A is a beam of wood of considerable depth, through which passes the horizontal shaft, b, extending back near the ends of the handles; by this means great strength is attained.

The plows, B, B, are of double construction, placed one above the other, and held together by double braces, standards and forked rods. In the middle of the back standards

PRESS PATENT AGENCY, and the third is pending. Further information can be obtained by addressing the inventor, John Mott, Danville, Contra Costa county, California.

AN EASTERN GOLD SWINDLE. — It appears that the reported discovery of gold in some borings taken from a well which was being sunk for oil, in Greene county, Penn., was a most unmitigated swindle. A company was formed on the strength of the reported discovery, stock sold, etc. The *Pittsburg Chronicle*, says that a party who was induced to buy some of this worthless stock, has entered a complaint against the person of whom he bought, and who was one of the getters-up of the swindling concern, for obtaining money under false pretences. The offending party, after a preliminary examination, has been bound over

PULVERIZED TURPENTINE AS FUEL. — This *American Journal of Mining* says: "Among the latest adaptations of heat-procuring substances to the furtherance of industrial art, is that of 'pulverized turpentine.' Captain Shpacovski, Professor at the Paul Military School, St. Petersburg, recently exhibited experiments upon this subject at the old Admiralty. By an apparatus which he called a pulverizer, he caused every particle of the fluid to burn. The flame from his apparatus was enormous, reaching two feet in height and rushing through the burner with a noise similar to that of steam escaping from a pipe. The temperature is equal to that of molten steel—1,040 deg. Reaumur. After melting wire, copper, etc., and showing how it was adapted to carbonizing wood for ship-building to the depth of only 1-120th of an inch, he proceeded to describe his steamboats. The model experimented with—twenty-four feet in length—was propelled at the rate of six knots per hour, by an engine of two-horse power, heated by four pulverizers, consuming three pounds of turpentine per horse-power per hour. He expects to reduce this consumption to one and a half or two pounds per horse-power, and has orders for twenty similar boats to be used for passing traffic on the canals. The new fuel is more expensive than coal, but Captain Shpacovski claims that this will be more than compensated for by the smallness of the quantity used. Steam can be got up with it in ten minutes, and the fire can be extinguished immediately when not required."

"Pulverizing" is a term employed for the very fine separation of fluids, as through a rosette of extreme fineness. This method is employed in France, instead of vaporizing, for medical purposes. Its adaptability in rendering available liquid fuel, must be

apparent to every one. It is in this manner, if at all, petroleum will eventually come into use as fuel for the purpose of making steam. In this view the above described experiment of Professor Shpacovski, is very interesting.

DEATH OF AN ENGINEER.—William Petherick, a well known civil and mining engineer, died at the Cosmopolitan Hotel on Saturday evening last, of erysipelas. Mr. Petherick came to this State in the interest of some English capitalists, and his word would sell, in London, Liverpool, or Boston, any mine which he would endorse. His integrity was proverbial. California has met with a great loss in Mr. Petherick's death.

MECHANICS' INSTITUTE.—The reading and chess room of the Mechanics' Institute will be removed on Monday next, from the building on California street, to the temporary quarters selected on Market street, which will be used until the completion of the building in the course of erection by the Association. The library will not be removed until one week from Monday.

EMPLOYMENT WANTED.—The California Volunteer Union solicits employment for discharged soldiers. Their office is 625 Merchant street San Francisco.

are placed slots, to raise and lower the heel of the plow by loosening the bolts.

Adjustable washers are also placed under the ends of the braces and standards, as well as under the two boxes, a, a, to change to or from the ground. Both plows turn from right to left and left to right, on the horizontal axis, b, and the one not in use is kept in place, bottom up, by means of the hooks, d, d, attached to the sweep, E, passing through side-irons; and when the end of the furrow is reached, this sweep is raised, which lets the upper plow down where its point touches the soil, and the team on turning carries up the plow that has just been employed to the beam, where it is locked, and the lower one is ready for service.

The inventor of this implement justly claims that by its use the side-hill can be cultivated as well as the plain, as all of the furrows can be turned down hill; and where it is desirable to carry elevated ground to low or wet places, which are always unfit for seeding at certain seasons of the year, by this system of plowing, such places may gradually become elevated, and thus productive. In places where no dead furrows are wanted, as in plowing gardens or small patches of land, this plow is found more serviceable than any other.

Two patents for this plow have already been taken out, through the MINING AND SCIENTIFIC

to answer in this case. It is to be regretted that every operation of the kind cannot be thus promptly followed up, and their authors punished, as they should be, as swindlers. If such a course should be pursued, legitimate mining would be greatly benefited.

CONCENTRATOR ILLUSTRATION.—To such of our readers as are not familiar with the working principles of Hendy's self-discharging concentrator, we would call attention to a new engraving on the last page of this paper, representing a sectional view of the machine. A description of its structure and operation is also given. The Jersey Blue company, near Folsom, have ordered two of these concentrators through Palmer, Knox & Co. of the Golden State Foundry. Two more were also ordered this week through Messrs. H. J. Booth & Co., of the Union Foundry, for the People's Company in Alleghany, Sierra county. These are probably the first machines of the style purchased for Sierra. We are glad to see this disposition on the part of miners to improve their works.

INCREASED attention is being paid by our miners to the saving and treatment of the metallic sounds and sulphurets found in hydraulic and cement diggings. We shall have more to say of this hereafter.

A VALUABLE MINE.—A letter has just been shown us by A. S. Snyder, Esq., giving the result of a recent assay of nickel ore. The actual assay is nickel and cobalt, 6.45; iron, 23.50; sulphur, 20.00; arsenic, 15.05; gangue rock, 25.00; waste in experiments, 10.15; gold and silver, about \$3 per ton. It is probably the finest sample of nickel ore ever sent to this city. Each unit, or per cent. of nickel and cobalt, is worth about \$14, (or \$90 per ton). The two metals are rarely ever found separated; they combine in variable proportions, and generally with arsenic. The mine is situated above Dutch Flat, on the Pacific Railroad, and will pay a handsome per cent., if properly managed. It is owned, we understand, by Messrs. Gaskell & Co., whose name is a sufficient guarantee that the mine will not lack energy or means in developing its resources.

We clip the above from the *Daily Tribune*. In the mountains of Norway, where labor, coal, water, etc., are at the cheapest cost, it is found that nickel ores containing 6 per cent. of nickel and cobalt will barely pay the expenses of working. It is barely possible that the combination of the two minerals in the ore, as found near Dutch Flat, may be such as to render it possible that they may be worked at less cost than is usually involved in the working of that class of ores; although we can scarcely conceive any conditions under which cobalt and nickel ore of the grade named, could be worth over \$30 in this city, whither it will probably have to be shipped either for working or shipment.

NEWSPAPER IMPROVEMENTS.—The *Oakland News*, heretofore a weekly sheet, now comes to us as a daily. This improvement speaks well for the growth of our neighboring city, and for the enterprise of our worthy cotemporary.

The *Evangel*.—This organ of the Baptist interest on this coast, which has recently been greatly enlarged and improved in appearance, has now changed its issue from a semi-monthly to a weekly sheet.

THE DAILY TIMES, a new morning paper, said to be substantially backed by prominent men of this city and State, will soon make its appearance in San Francisco.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Mining in Reese River.

BY OUR AUSTIN CORRESPONDENT.

EDITORS PRESS:—At last our country, as a mineral region, is beginning to prove itself all, if not better than ever represented, though it has been up-hill work to effect the desired end. Much is yet to be done, however, before there is a thorough system of mining adopted, and everything will move along smoothly. There is much to be learned, and large sums of money will be squandered in experimenting.

This is a progressive age, new inventions are daily being brought before the people, some of which are practicable, while others are not; and inexperienced men are the first to adopt new inventions, they not knowing the value or practicability of them; for instance, the much talked-of "Gardiner's or Humboldt crusher," the unsurpassed good qualities of which were heralded by almost every journal in the land, with the exception of the PRESS, which, I believe, "did not see it." One of those machines was erected and tried here, but would not work up to expectations. It was not complete, the owners believing it would work to a charm if it had stamps and other fixings attached to it; in short, it would not answer the purpose, therefore the agents suspended operations until means could be collected wherewith to purchase some other new patent. People in the East were so infatuated with this machine, that a Philadelphia company shipped one of them for this place across the plains, and also a full complement of mill machinery, doing so at the instigation of one as inexperienced as themselves. After much tribulation, and, as the agent says, "bridging the whole line of road from the Missouri river," they eventually landed a portion of the cargo at Salt Lake City. Had the cargo all been delivered here, the company's books would have shown a cost of one dollar per pound freight on the same. Another monster machine must be hauled here to be voted by the owners as worthless—"Howland's Rotary Roaster." It was tried in one of our largest mills and found wanting. One of our leading speculators purchased one of them, but through accident did not ship it immediately; afterwards, having seen a test made of one of them, he rescinded the order, much to his relief and repute as a practical mill and mining engineer.

I do not mean to infer that new inventions are not sometimes worth trying, but that in many cases, by lack of judgment in their utility, much valuable time is lost, thereby tiring the patience of stockholders, who are daily and hourly becoming more anxious that results shall be shown in their enterprises. Being as far removed from manufactories as we are, it is not practicable to experiment to such an extent here as some do. Much time is consumed in forwarding machinery, and freights foot up largely. For the present, at least, no machinery should be ordered except that known to be applicable. But with all drawbacks we are working out our certain success. The production of bullion is increasing daily. Last month's shipment is surprisingly large to us, and will set those to thinking who have formed a poor opinion of our mines. The total shipments of bullion for the month of June was \$101,516.26—Wells, Fargo & Co. having forwarded \$66,957.50, and the National Bank \$34,558.76, in addition to which Dr. Goodfellow shipped on the first and third of the present month nine bars, extracted from one week's run of ore from the Great Eastern mine. The bars were shipped through Messrs. Wells, Fargo & Co., and were valued at \$10,417.46. The ore from which it was taken averages \$200 per ton. The Great Eastern Company are still furnishing good quantities of ore, which is being reduced at the Keystone mill, under the supervision of Capt. A. L. Page, the lessee of the mill, who is making every one feel glad by producing 600 pounds of crude bullion daily from the Great Eastern ore alone.

In my last letter I spoke of the probable yield of ore from the Yankee Blade mine then in course of reduction at the Midas mill, having only judged of its value from appearances of the ore in bulk. I underrated the working of it (something very unusual for this country), and therefore take pleasure in acknowledging the error, and setting your readers aright. I will so do by inserting a notice made at the time in the local columns of the Reese River *Reveille*, which notice bears me out in my former expressions of approval of the management of said company's works:

"HANDSOME WORK.—The Midas mill, of the New York and Reese River company, well sustains its reputation. The amount of bullion produced from June 1st to the 24th inclusive, was \$35,253.57. Of this sum \$23,918.42 was obtained from 70½ tons of ore from the Yankee Blade mine, belonging to the company, the ore averaging \$339.26 per ton, and the bullion being of the extraordinary fineness of 994. This unequalled result in this region is highly creditable to the thorough management of Mr. W. P. Richard, the intelligent general agent of the company."

Who can say that our mines cannot be made to yield? Veins on which depth has been attained are yielding well. It is true it costs more to work small veins than those of greater width and lesser depth, still the yield per ton is greater, making up the discrepancy.

There is much being done on mines having proved themselves good, in the way of sinking new shafts and erecting new machinery, consequent upon the "Cheap John" system of working adopted by the inexperienced; but it is to be hoped that agents will learn in time, that mining, if worth doing at all, is worth doing well and substantially. A desire can be daily seen on the part of capitalists to better their condition through practical working, acknowledging that it is the only sure way to success, although there are many who overestimate their own ability in occupying positions of superintendents of mines.

I can now say of the Philadelphia district, that it has proven itself all that was represented. Heavy purchases are being made of interests there. The ledges are large, and as far as can be learned from the developments so far made, are well defined and permanent. The High Bridge and El Dorado mines or ledges, if all is true, must eclipse the famous Constock. Certain it is that the out-crops of these mines are large, and will average over \$100 per ton. We all look at this discovery as an event in the history of our country, and think that further developments will replace the confidence heretofore had in the country, but which has been doubtful for some months back.

The fact of much "wild cat" having been sold in the East has given capitalists cause for being wary, and although there are millions of feet of mines in the East on sale and undeveloped, it would be better for the country if none of them are disposed of on the representations made by the sellers. The picture is overdrawn, painted and touched up to such an extent, that it is an utter impossibility that mines can work up to such statements. Consequently purchasers are disappointed, and therefore judge all our mines by one. There are plenty of opportunities to purchase here, and to see what is being purchased; also to see the requirements of the mine in machinery, etc., thereby guarding against the misapplication of money in useless machinery.

It is a fact worthy of note that all who come here for the purpose of examining the mines are pleased with them, and to a man become interested in them. All are of the opinion that the mines will yield largely if properly worked. If that is our only detriment to success, why is it that men will not use some judgment in working, and try to learn that right way? Capitalists find fault that their mines are not productive. They alone are to blame. They will see their error in time, but at the present many of them could not be made to believe they could be wrong.

Agents are employed to further work and make money for their employees, which no doubt they try to do, but in their efforts to make money the idea that a "dollar saved is a dollar earned" never occurs to them. They are virtually sent here with the intention of saving money as well as to make it, which they invariably get wrong end first, through ignorance in their positions as superintendents.

Austin, July 7th, 1866. PROGRESS.

The total amount of gold and silver ore extracted from the earth up to the present time, as far as can be ascertained, amounts to about \$22,000,000,000 of which only about one-fourth at present remains in existence.

[Written for the Mining and Scientific Press.]

Letter from Copperopolis.

EDITORS PRESS:—On my return to this place, after an absence of two and a half years, I could not resist the temptation of visiting my old stamping-ground, the Keystone mine. I have ever felt an earnest wish for its success, and also for the success of the gentlemanly stockholders, some of whom are my personal friends. My connection with the mine cost myself and brother a considerable sum of money. But I have no ill-will towards the mine owners; on the contrary, I would take great pleasure in seeing it become one of the best paying mines in the country. On my arrival I called upon the gentlemanly superintendent, who politely showed me the work and improvements above ground, but as positively declined putting me below to see the mine. During my thirty years' experience in mining, in the positions of engineer, superintendent and owner, I have always looked upon the mine below ground as the real point of interest, and I have cared not to see lofty edifices adorned with gilt and paint, or polished machinery, where appearances have been made subservient to utility, placed over unprospected, and consequently, unproductive mines.

Where is the ship-owner who would think of putting gilded top-hamper upon a rotten hulk, and freight her with costly cargo, expecting a prosperous voyage? Where is the merchant who would spend his capital in painted paneling, and commence business with empty shelves? Why, then, do merchants, when they become miners, waste their substance upon useless show above ground, when their money is needed to sink, drift and explore the mine? When the mine is paying more dividends than the stockholders know what to do with, then it may be fitting and time enough to spend their surplus in adornment.

There is immense mineral wealth here and in this vicinity, but it requires capital to bring it to light, and that capital or the greater part of it should be spent under ground and not above. I was surprised in not seeing more ore raised from the Union mine. As there is a reason for all things, there must, therefore, be a reason for this also. The Union company has been sued by a party who own a side claim, and who lay claim to the Union lode also. Sam Smith of to-day may be John Jones of to-morrow, but that will be no evidence that this mineral may not exist in equal abundance in the possession of either.

The Empire and Calaveras claims, undoubtedly, will some day be good paying mines; but not until the stockholders realize the fact that experienced miners only should be employed to superintend, and that inexperienced owners in their counting-rooms should not dictate too much to those who have made mining their business for life. Shafts may be sunk, but if they are not put down in the right place all is lost. There are also some good mines outside of this immediate vicinity that are worthy the attention of capitalists. I have visited the Napoleon mine, and shall always say that it is a mine, if the right man is found to superintend the sinking of shafts, drifting, etc.

R. POWING, Min. Eng.
Copperopolis, June 21, 1866.

[Written for the Mining and Scientific Press.]

From the Humboldt Oil District.

MESSERS. EDITORS:—I was delighted to find at the Post Office last Thursday, on the arrival of our weekly mail, a copy of your valuable paper of the 16th ult., and as a slight indorsement to continue the favor, I have decided to inform you of the condition of affairs in this vicinity, more particularly as regards a branch of mining of which I read but little in the copy before me.

That petroleum exists in this section one cannot doubt, without discrediting his own senses. Even on the surface the oil can be seen oozing from the rocks, and I have, by simply making use of a woollen rag, collected from three to five gallons in the course of a few hours, within ten miles of this camp.

Nothing would seem to be required for the full development of a paying well but the proper expenditure of capital—by the employment of intelligent labor, and working superintendents. That such has not been done, is evident from the numerous abandoned derricks and wells in this vicinity.

Among the number of oil wells now being worked are the following: The Erwin Davis, down over one thousand feet, with but little, if

any, encouraging prospects. The Jeffrey, down 600 feet, with good indications, constantly improving as they descend. The Union is down 210 feet, but is during this week not being worked, to enable the boys to celebrate the "glorious Fourth," after which they purpose continuing the work.

The North Fork company are down 276 feet, and are now piping, having down 222 feet of pipe in the shaft. The prospects of this well are flattering; oil in small quantities is taken out daily by pumping.

The other wells in this vicinity are either abandoned, under attachment, or work suspended—the Allen & Satter, and Tilden and Fowler being of the latter number, and when they will resume labor is a question not to be answered at present. It is evident that stockholders are tired of paying assessments, while those laboring on the works are dissatisfied with not receiving the just remuneration for their labor. But better times are hoped for by

DEX.
North Fork of the Mattole, Cal., July 21, 1866

Oil Prospecting Extraordinary.

It was announced, last spring, that oil had been struck within the limits of the city of New York, and not far from the First Avenue. No sooner was this announcement made, than a party of speculators forthwith commenced boring within the city of Philadelphia, at a point near the junction of the Wissiniekon and Schuylkill. Two wells are now being put down in that locality. Gas, and a small show of oil, was observed within twelve feet of the surface. One of the wells, at last accounts, was down 240 feet, with encouraging prospects.

Our readers are already familiar with the boring operations on the Potrero, near the terminals of the long bridge, in this city. They are now down some 300 feet. Whether oil in paying quantities will be struck, is a matter for the future to decide; but that indications of oil are found there, and that a small quantity of oil has been skimmed from the surface of the water raised from that well, we have good reason for believing.

It may not be out of place in this connection to note the fact that Mr. W. H. Jones, an experienced Pennsylvania oil operator, has recently obtained some special concessions from the Imperial government at Mexico, under which he has already made some important oil developments near the city of Mexico. We clip the following singular extract in relation to his operations from an Eastern exchange:

"The church of Guadalupe is situated at the foot of the high bluffs about three miles north of the city of Mexico, and is celebrated as being the oldest and richest on this Continent. At the laying of its foundation, over three hundred years ago, it seems a vein of oil was struck, which has been continually flowing since. It was soon discovered to possess medicinal properties, and was supposed to be a commendatory blessing, from the Virgin of Guadalupe, on the enterprise that was raising up so beautiful a temple for her worship.

The fame of this ointment was soon told throughout the land, and the people came from a distance of a thousand miles to be healed. It is proper to add that this was not an unprofitable speculation, as the priests managed it carefully and sold the wonderful fluid at a dollar an ounce in gold. The arrival of Mr. Jones, however, and his examination of the mineral, resulted in his proclamation of the discovery that it consisted of petroleum, and, despite the earnest protests of the priests, he produced a mining patent, according to the laws of the country, which gives him the privilege of excavating and boring in the very centre of the holy convent itself if necessary. He put down seven wells, varying in depth from fifteen to fifty feet, and in every instance found an excellent show of oil, one of which produced fifteen gallons per day. A remarkable feature of this oil is its purity, it being perfectly clear and lighter than most of our refined oil, and burning with a clear and brilliant light as taken from the well, without refining. The city of Mexico now depends on the United States for its illuminating material, and oil with heavy duties and expense of packing over the mountains on mules' backs, a distance of three hundred miles, swells the cost, when landed in that city, to \$2.50 per gallon in gold. With this and the surrounding cities it seems there is ample market for a large quantity of petroleum, and with the high rates it commands, and the cheapness of labor, this promises to be a profitable speculation."

A PENDULUM, thirty-nine inches in length, gains a second in every thousand, and one of 39.2 loses seven seconds in every ten thousand. The first pendulum clock was made in 1641, for St. Paul's, Convent Garden.

Mechanical.

EFFECTS OF WATER ON MOLTEN IRON.

Two accidents of a somewhat singular character have recently been noticed as having occurred—one at a foundry in Troy, N. Y., and the other at a foundry at Barnstable, Mass. The former is described as follows:

At the Clinton Foundry, Troy, on Wednesday, there was a decidedly novel and dangerous eruption of liquid fire. The workmen approached the eupola, and tapped it to fill their ladles as usual. One of the ladles proved to have been wet, and exploded, scattering the fire in all directions. The men naturally ran away to avoid being burned, and the stream of molten iron came pouring out on the floor, rendering it so hot as to be impossible to approach the place, and it spread over the floor a perfect river of fire, until the muck was exhausted. A number of workmen were burned, but not so as to disable them.

The Barnstable *Patriot* describes the accident at Barnstable as follows:

It appears that it has been the habit of moulders to turn melted iron into water contained in wooden pails, in order to heat it for washing purposes, but on this occasion a wooden pail not being at hand, an iron one was used, which proved rather a dangerous experiment. No sooner did the lava touch the water than the pail burst with a report loud as that of a cannon, and the fragments of the pail were thrown in every direction with such force as to go through the walls of the building, and perforate iron pots standing ten feet from the pail. Several of the workmen were knocked down, but miraculously saved from serious injury.

Reading the above reminds us of several experiments recently made by a gentleman of this city, preliminary to carrying out a patent project in which he was engaged for preventing the explosion of steam boilers. The experiment to which we particularly refer was described to us as follows: He took a small four-pound cannon ball, dipped it into water and then placed it into a long, inclined spout, down which it rolled until it dropped into a ladle of molten iron which had been placed to receive it. The result of the contact of the wet iron with the molten mass was an instantaneous explosion, which threw every particle of the molten iron out of the ladle. This was repeated several times with a like result. The cause of the explosion was the sudden decomposition of the water and burning of the hydrogen, by being liberated in immediate contact with the atmosphere and the hot molten iron.

PEAT FOR FUEL ON LOCOMOTIVES.—A trial of the value of peat as fuel for making steam on a locomotive was recently made on the New Haven, Hartford and Springfield Railroad. The peat was pressed. The trial was made on a special trip carrying the Superintendent, Directors and invited guests. The result is summed up as follows:

The whole distance to Springfield and return (fifty-two miles), consumed but about twelve hundred weight of peat. In the generation of steam, it far exceeded either wood or coal, and even while running at the greatest speed, so rapidly did it gain, that the furnace door had to be thrown open. The last six miles of their return trip was made without using a particle of fuel. One great consideration, which will be hailed with joy by the traveling public, is the entire absence of smoke or cinders, the whole substance burning to ashes. The engine, on its return, was apparently as free from cinders as when it first started out. The trip was conceded to be a perfect success in all respects; in fact, more than realizing the anticipations of its most earnest friends. The peat was obtained from the company's heds, on the line of the road, between Berlin and Meriden; and has demonstrated the fact that it will supersede both wood and coal for general use.

OWNING UP.—The London *Standard* says: "Already the Americans have made fifteen hundred 15-inch guns, which have been tested to be perfectly safe for a thousand rounds with spherical shot of 440 pounds, and powder charge of 50 pounds. They have also 20-inch guns, throwing round projectiles of 1,080 pounds, with a powder charge of 100 pounds. These guns have been tested to 808 rounds. The turret ships *Puritan* and *Passaconaway* are armed with these 20-inch guns, and from the nature of their armament would be more than a match for the whole of the English iron-clad fleet combined."

TREES, etc., which fall into the pitch lake of Trinidad, soon become true coal.

MACHINE HAMMER FOR DRILLING.—At a recent meeting of the American Institute, New York, Mr. Hyde exhibited an ingenious hammer, operated by a crank, to be used for striking drills in an inclined or horizontal position in drilling rock. It promised to be particularly useful in tunnels where drills were introduced inclining upward. The machine would operate a hammer weighing twenty-five pounds with ease. Men can strike directly with sledges either perpendicular down, or slightly inclined, but this instrument greatly reduces the labor in striking upward. There is eccentric gearing which draws the hammer backward slowly, but strikes it quickly forward. The editor of the N. Y. *Stockholder* has seen this hammer, and thinks it well calculated to effect a saving of muscle in mining and quarrying operations.

PAPER PIPES are becoming quite generally used in France for water and gas. They are made from two inches to two feet in diameter, and sometimes half an inch thick, at which thickness they will withstand a pressure of 500 pounds to the square inch. These pipes are made by passing a strip of paper through molten bitumen, and then winding it round a mandril under pressure. Pipes as large as two feet in diameter have been laid in the streets of Paris. Both gas and water companies have used them.

TESTS OF RAILS.—The following tests of the strength of different kinds of rail to resist the blow of a hammer, were made at the machine shop of the Boston and Providence Railway Company, under the supervision of the master mechanic, Geo. S. Griggs, Esq. The rails were placed under the steam hammer separately, resting on blocks of iron placed fourteen inches apart. Each piece of rail was about three feet long, and each received the same drop of hammer weighing 700 pounds:

	lbs. to yd.	No. Blows recd from steam hammer.	Bent.	Dented.
Cast-steel rail.....	60	85	3 1/2 in.	1 1/2 in.
Steel headed rail.....	63	42	3 1/2 in.	1 1/2 in.
Eng. rail, 2 samples.....	55 ea.	24 ea.	3 1/2 in.	1 1/2 in.
English rail.....	56	13	broke.
Our common rail.....	56	13	3 1/2 in.	3 1/2 in.

There was no fracture in any of the above rails except in the English rail marked "broke."

CHINESE ENGINEERING.—We have no hydraulic construction as great as the Chinese canal, no fortifications as extensive as the Chinese wall; we have no artesian wells that at all approach in depth some of theirs. We have not yet resorted to the practice of obtaining coal from the interior of the earth; they have borings for that purpose more than 3,000 feet deep.

A USEFUL ALLOY.—An alloy consisting of 10 parts of cast-iron, 10 of copper, and 80 of zinc does not adhere to the mold in casting, and it is of a beautiful luster when filed and polished. The most fractious metals are melted first and the zinc last in making it.

BUILDING SUPPORTS.—In the old Saxon cathedrals one-third of the entire area was employed for walls and piers; in the Pantheon at Rome, one quarter; in St. Paul's, one-sixth; in the Crystal Palace, only one two-thousandth part of the area covered is occupied by walls and supports.

SLEEPERS made of mahogany are almost indestructible to the attack of the white ant and seaworm. An engagement has just been entered into to deliver on board a ship at Fremantle, Australia, 600 loads of such sleepers, for an Indian railway, at £3 13s. 6d. per load.

M. H. St. Claire Deville succeeded in fusing and casting in a mold upwards of two hundred weight of platinum. During the operation considerable quantities of the fumes of osmic acid were evolved, which seriously affected the health of the operator.

INTERESTING CHEMICAL DISCOVERY.—M. St. Claire Deville succeeded in resolving carbonic acid into an explosive mixture of oxygen and carbonic acid. This was accomplished at a temperature of about 1,300 deg. cent.

TRUBAINE made a mirror of eleven feet focus. It melted steel in five minutes and silver coin in a few seconds.

It has lately been discovered that sodium or potassium placed in contact with gun cotton will cause the latter to explode.

COPPER precipitated by galvanism is much harder and more dense than when cast or rolled.

A NUMBER of engines have recently been stolen from the oil regions of Pennsylvania?

Scientific Miscellany.

ALLYLE.—How few there are who know anything about "allyle," yet, in some shape or other, it forms a portion of the daily banquet of all the human race. The pungent taste of watercresses, of onion, horse radish, chive, garlic, leek, assafetida, shallot, radish, and common mustard, is entirely owing to a certain combination of allyle. When onions are chopped fine, a pungent vapor arises, the effects of which are well known by its making "the eyes water." This volatile substance is a peculiar essential oil, or otto, so small in quantity that a cwt. of onions, on being distilled, only yields two ounces. This substance is a combination of sulphur and allyle (sulphuretted allyle). It is very remarkable the characteristic burning flavor of this substance should prevail in plants so totally different as watercresses, garlic, etc., and that man should have selected them for food to gratify some peculiar instinct—some bodily want. From the Firth of Forth to the banks of the Nile, the onion, the assafetida, and all those plants which contain allyle, are esteemed as relishes. By Europeans the assafetida is considered unpleasant; but in Asia it is collected and sold as a condiment. Even among ourselves there is some difference of opinion respecting the use of those plants for food which contain allyle. The poor rarely require mustard to relish their beef; and among the rich it is considered the height of vulgarity to eat a leek or an onion. The general taste, however, for these plants may be traced to the most remote ages. When the Israelites were sojourning in the wilderness, they murmured, saying: "We remember the cucumbers and the melons, and the leeks, and the onions, and the garlic." (Numbers xi., 5.) It appears that a certain portion of allyle is essential to our health, and that, like the instinct which induces us to eat salt, we have searched out those plants which contain allyle, and mix them with our daily food. We cannot exist without salt, nor can we thrive without allyle. It is a positive fact that those families who reject the use of those plants which yield allyle, such as the onion, etc., become degenerate, and finally extinct. Such is the penalty of fashion. The name of this active principle—allyle—has been given to it from the generic name (*Allium*) of the plant in which it is found.

INTERESTING EXPERIMENT.—At the last meeting of the Chemical Society of Paris, Dr. Phipson called attention to the sudden fall of temperature which occurs when certain metals are mixed together at the ordinary temperature of the atmosphere. The most extraordinary descent of temperature occurs when 207 parts of lead, 118 of tin, 284 of bismuth, and 1,617 of mercury are alloyed together. The external temperature being at $+170^{\circ}$ centigrade at the time of the mixture, the thermometer instantly falls to -10° below zero. Even when these proportions are not taken, with absolute rigor, the cold produced is such that the moisture of the atmosphere is immediately condensed on the sides of the vessel in which the metallic mixture is made. The presence of lead in the alloy does not appear to be so indispensable as that of bismuth. Dr. Phipson explains this fact, by assuming that the cold is produced by the liquefaction at the ordinary temperature of the air of such dense metals as bismuth, etc., in their contact with the mercury.

LOCAL ANÆSTHESIA.—The subject of local anesthesia, to which the medical attention has lately been directed, has been carefully pursued by Dr. B. W. Richardson, and with much success. Operations of the most severe kind have been performed on parts narcotized by his process, without the least sensation of pain on the part of the patient. In this method the patient retains his consciousness completely, but the part to be operated on is deprived of sensation. A new agent for the purposes of local anesthesia was suggested by M. Delcominate to the Surgical Society of Paris at a late meeting. It is bisulphide of carbon. It produces refrigeration in less than a minute, and more completely than ether. The great objection to the suggested fluid is its smell, which is abominable. M. Delcominate, however, has described a process by which much of this smell may be removed.

A NEW DISEASE has been described in the *Journal de Pharmacie*, to which Dr. Callani gives the name of "acetonic." It is thought to be produced by the formation of a chemical compound called acetone in the system, which compound arises from the fermentation of organic matter in the stomach.

IVORY when cut in slices of a thickness of one-twentieth of an inch, becomes transparent in liquid phosphoric acid of a specific gravity of 1.131. The ivory is washed, after the immersion, in clean water, and dried with a linen cloth.

HYDROGEN passed over phosphorus contained in a glass tube takes up sufficient of that substance to color the flame green.

PROFESSOR SCHONBEIN has discovered a new method of procuring the per-oxide of hydrogen, which consists in simply agitating, in a large flask, to which air has access, amalgamated zinc, in powder, with distilled water. Oxygen is then absorbed by both the zinc and the water, with formation of oxide of zinc and peroxide of hydrogen. The peroxide of hydrogen obtained by this method, unlike that obtained by the ordinary process, is quite free from acid, and so may be kept for a long time without decomposition. It does not contain, moreover, a trace of either zinc or mercury, but is absolutely pure. This new process has therefore great advantages over the old process of preparing peroxide of hydrogen, both as being far simpler and more expeditious, and as yielding a much purer product; but it is almost as far as the old process from yielding peroxide of hydrogen cheaply enough for use in the arts.

SPIDERS AND THE TELEGRAPH.—It has been found that one great difficulty to be met with in telegraphy, arises from the webs of spiders, which, when extending in great numbers from the wires to trees or the ground, and being wet with heavy fogs or gentle rains, become so good conductors as to seriously impair insulation. Who can overcome the mighty obstacle imposed by a spider's web to the progress of the telegraph!

NEW PROCESS FOR MAKING WHITE LEAD. M. Torreggiani recently informed the Academy of Sciences at Paris, that after repeated experiments, he had proved that a galvanic pile in which the positive pole was represented by metallic lead, and which contained a saline solution (an alkaline acetate), gave a large quantity of pure carbonate of lead besides electricity, which might be profitably employed. M. Torreggiani considers that is an easy and innoxious way of making white lead.

SILK FROM FISHES.—M. Joly, a well known French chemist, has found, singularly enough, within the bodies of certain marine fishes, a substitute for the cocoon of the silk-worm. The exterior envelope of the eggs of the fishes in question consists of a very fine tissue composed of an immense number of exceedingly delicate filaments, which admit of being readily separated, and then exactly resemble those of ordinary silk. The eggs are one-quarter of an inch in diameter one way, by one-eighth the other, and in their interior is a white albuminous matter, which M. Joly believes can be utilized in calico printing, and a yellow coloring matter, which he imagines may prove valuable as a dye. The obtaining from the envelopes of the eggs of a material for textile fabrics, closely resembling ordinary silk, he declares to be economically practical on any scale.

DISSOCIATION OF GASES.—In a recent memoir, M. Cailletet has published some interesting statements upon the subject of the dissociation of gases under high temperatures. He collected the gases proceeding from a peculiar form of furnace, in which charcoal and coke were burning, and from his analysis of them he has been led to conclude that oxygen has no action on hydrogen, carbon and carbonic oxide in the midst of a combustible mass, which is maintained at a temperature higher than that of the fusing point of platinum. The following are the figures resulting from the analysis made by M. Peligot:

Oxygen.....	15.24
Hydrogen.....	1.80
Carbonic oxide.....	2.10
Carbonic acid.....	3.00
Nitrogen.....	77.86
	100.00

TOBACCO.—M. Melsens, a French chemist, has found that tobacco from various countries, contains nicotine in very different proportions. In tobacco from some parts of France there is 7.96 per cent. of nicotine; whilst from Havana tobacco contains only two per cent. He proposes to smokers a way of preserving them from the effects of alkaloids by putting into the tube of the pipe or cigar-holder a little ball of cotton, impregnated with citric and tonic acids. As the smoke passes through the cotton, it will deposit the nicotine therein, in the shape of tannate and citrate.

WATER IN A VACUUM.—By placing water in a flask in the vacuum of a good air-pump, and heating it by the transmission of a strong electric current, Mr. Grove proved that the water did not boil at all, but that the whole burst up into violent convulsions at regular intervals.

The window of a photographer's "dark room" may be painted with a mixture of acid solution of sulphate of quinine in dextine or gum arabic. The mixture should be applied on a sheet of paper, and this placed on the glass, and it is said no actinic rays, even on the brightest days, can pass a window so prepared.

Tuesday, July 17.

144 shs Ophir at 245 per foot.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, July 21st, 1866.

A fair inquiry for money prevailed on Saturday, but since then the market has been easy. The demand for regular business purposes is small, and the speculative requirement exhibits no new feature. The rate of discount in Bank is 1½ per cent. per month, and in the open market, 1½ to 2 per cent.

Messrs. N. Luning, D. J. Tallant, and L. Saachs have been chosen Directors of the Bank of California, to fill vacancies. The capital of the Bank is now \$5,000,000, all paid up in gold.

Currency bills on the Atlantic are offered at 45 per cent. premium on gold. Sight drafts payable in coin are quoted at 2½ per cent. premium, and Telegraph Transfers are made at 3 per cent.

Bullion has been in good request. Gold Bars may be quoted at 860 to 870. Silver is worth about 1 per cent. premium for nverage bars. Receipts of Treasure from the interior since the date of our last reference, amounted to \$950,000, making an aggregate of nearly \$3,000,000 thus far during the current month.

Our Treasure export during the first half of the past three years, has been as follows:

	1864.	1865.	1866.
To New York.....	\$ 5,607,940	\$ 9,918,794 61	\$ 14,970,863 87
To England.....	19 8 5-269	9,761,532 00	3,305,527 11
To China.....	2 9 1-753	373,928 00	3,745,815 52

The increase in the exports of treasure this year, as compared with that of last, is \$2,357,115. The Sub-Treasurer of this city has made a number of shipments to the East since the beginning of the year, amounting in the aggregate to \$5,500,000, which are not embraced in the above table.

The following table, showing the total disbursements and revenue of the Government for the first six months of the past as well as of the present year, is of some interest:

	First half of 1865.	1866.
DISBURSEMENTS.		
Army Service.....	\$ 105,977	\$ 219,401
Naval Service.....	5,000	6,000
Revenue Service.....	285,000	3,000
Postal Service.....	175,000	170,000
Miscellaneous.....	180,000	181,000
Totals.....	\$ 8,275,977	\$ 6,534,400
REVENUE.

Hale & Norcross was sold at \$1,250 to \$1,275 ex-dividend, and close at \$1,300 asked. The product of the mine for the first half of the month exceeded 1,300 tons of ore, worth an average of about \$155 per ton. In raising 30 feet above the 135-foot level, the lode continues to look well, and a body of ore 595 feet in depth has now been developed. This shows in some places a width of 30 feet, and extends 200 feet in length.

Savage rose from \$885, seller 30, to \$950, receded to \$911, and sold yesterday at \$930 to \$900. Advices continue favorable, and the surplus at the credit of the company has materially increased since the 11th instant.

Gould & Curry was sold at \$740 to \$722½, closing at \$700. Receipts of bullion for the first fifteen days of this month amounted to \$41,500 from the company's mill. A large portion of the net earnings are being applied to the purchase of supplies for the winter, and a recent purchase of some 4,000 cords of wood involved an expenditure of \$56,000.

Crown Point is in better favor, advancing from \$715 to \$850, and closing at about \$800 bid, \$820 asked. Repairs to the shaft and improvements at the Rhode Island mill are progressing favorably.

Yellow Jacket declined from \$625 to \$545 ex-dividend, rose to \$570, and sold yesterday at \$595 to \$565. During the week ending 9th inst., 1,577 tons of second class ore were extracted, and the total yield of bullion exceeded \$48,500.

Ophir has attracted more attention, and nearly 200 feet were sold, advancing from \$248 to \$325, receding to \$290, and selling yesterday at \$275 to \$280. A new development was made a few days since in the 8th gallery, 30 feet south of the Mexican line, and latest telegraph advices state that the ore met with is improving and the vein well defined.

Chollar Potosi has been dealt in within a range of \$193 to \$185, closing at \$187. In the various stations throughout the mine there is no change whatever to report. During the week ending 13th inst., 583 tons of ore were sent to Custom Mills.

Belcher declined from \$160 to 137½, rallied to \$157½, and sold at the close at \$146.

Imperial is inactive, but well held, advancing from \$90 to \$92, and selling yesterday at \$94. Receipts of bullion for the first three weeks of this month are nearly up to the average of a corresponding period last month.

Overman has continued to be very actively dealt in at fluctuating rates, rising from \$41 to \$64½, then declining to \$52, and selling yesterday at \$45 to \$39. With respect to the real character of recent developments advices are somewhat conflicting, but in the main favorable. Bullion fell from \$51 to \$42, closing at \$46. Sierra Nevada fell from \$6¼ to \$4, rose to \$6¼, and closed at \$5.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday amounted to \$482,106.

Mining Summary.

CALIFORNIA.

Alpine County—

The *Alpine Miner* of July 14th, says: A ton of ore from the Kohinor was worked last week at Whiteside's mill. The return as given was at the rate of about thirty-three dollars per ton, but as the parties who worked it were not practical amalgamators and were not themselves satisfied that they had obtained all they should from the rock, the tailings were carefully saved and an assay made, giving a return of over one hundred dollars per ton in gold and silver. Work will commence on the Buckeye No. 1 immediately on the arrival of the pump and hoisting works.

The Silver Mountain *Bulletin* of same date, gives these items: In the George Washington a furnace will be built, in connection with Whiteside's mill, and by the time it is completed, which will not be over three weeks, the main lode will be cut through the cross tunnel, that will supply an abundance of rock of the richest character. The Morning Star company, Great Mogul district, in drifting north in the ledge, have struck into the "black ore" again, and, from the large volume of water that has of late burst forth, they are confident of being near the second chimney. The Balacava company are vigorously pushing ahead in their tunnel. The vein-stone is increasing in thickness as they penetrate the mountain, and the quality of the rock improving. Buckeye No. 2 have their tunnel heavily and securely timbered, and their "shute" built, and are ready to land reasonable quantities of rich ore at their dump daily. The Mountain company's tunnel is now in near 900 feet. It is to strike the main lode 1,000 feet below the croppings, and is expected to be completed by January 1st, 1867.

Calaveras County—

The Copperopolis *Courier* of July 14th, has these items:—

We were shown, while at Mokelumne Hill, a few days since, some extremely rich specimens of quartz from a claim in Rich Gulch, near Golden Gate, about five miles from the Hill. Work is still progressing in the Caledonia mine, the prospects of the claim offering inducements to the company to continue operations. The Leonard Claim, situated near Tuttle town, is now being worked with energy. In the bottom of the shaft the lead is said to be somewhat richer than at any place above. Work on the Kentucky Claim is going on briskly, with no material change. Prospects in the Antelope are brightening.

From all portions of the country we continue to hear the most flattering reports in relation to our quartz interests. A much larger number of miners are now engaged in prospecting and working quartz leads than ever before in the history of Calaveras. New discoveries are of daily occurrence, and claims which were partially prospected and abandoned years ago, are being re-located by parties who will thoroughly test them. At West Point—the "Grass Valley" of this county—a large number of mills are in active operation. Gouldson & Co. had eighty tons of rock crushed at Smith's mill recently, which yielded them \$150 per ton, leaving them, after deducting all expenses, a profit of \$11,200. Quartz of extraordinary richness was discovered on Monday last in the claim of Beals, Butler & Co., near Railroad Flat. It is said to be nearly one-third gold. Quite a number of surface claims are being successfully worked in Rich Gulch. Lamphear & Co. are employing a large number of hands in their claim, and work is being prosecuted night and day. Their new 10-stamp mill works admirably, crushing from 12 to 15 tons of rock in twenty-four hours. We understand that this claim is yielding largely. Labor has been suspended on the Sulphuretted claim, for a few days, in order to make some alterations in the machinery. Work is steadily progressing on all the other claims in this vicinity.

Humboldt County—

The *Times* has this item: We have received favorable intelligence from the well of the Fortuna Petroleum company, located on Bear River. The well is down five hundred feet. The drill is now passing through a soft gray sandstone, which is strongly impregnated with the odor of petroleum, and from which issues a very strong volume of gas.

Los Angeles County—

From a letter to the *News* of July 6th we gather these items: The San Fernando Petroleum company, under the superintendence of Mr. F. J. Hughes, is progressing very favorably. The oil from this well is of a very superior quality. Mr. Hughes has just put up a pump, the first one in this district.

The Moore springs also will soon be vigorously worked; their present capacity may be four to five barrels per diem. The Wiley and Tously springs are progressing famously. At the Wiley springs there are two drifts running into the banks, one of which is about 170 feet, and has two air shafts; the average pro-

duct of this drift is some 60@70 gallons daily, and the oil is of very excellent quality.

The Tubbs company, half a mile above the Wiley, have lately sunk a shaft with very flattering prospects for boring. The rice spring is being steadily worked, and the oil improves as a greater depth is reached. The Pioneer well is about to resume work.

Mariposa County—

From the *Free Press* of July 14th we clip the following: Messrs. Green and Snediker shipped 22,400 pounds of copper over to Stockton, on Tuesday last, from their vein in the Hamilton district, in this county. This is the first shipment they have made. The ore is of a rich quality, and from specimens shown we doubt if it can be excelled in the State.

Mono County—

A correspondent of the *Atta* writing from Sonora, June 27th, says: Ore from the Elmira and copper lodes, in Hot Springs district, yielded over \$300 per ton. The only trouble is the cost of smelting of the ore. Understanding that the Haskell patent, for working copper, had proved eminently successful, the writer went to the trouble of riding from this point to Buchanan Hollow, on the Chowchilla, to examine it. The furnace will, with a few trifling alterations, succeed in smelting and reducing those ores of Hot Spring, Montgomery, and other districts, that now delay the mill process. Owing to the charge, \$100 per ton, for smelting ore, by the furnaces already erected in Mono county, an immense quantity of good ore, worth from \$75 to \$125 per ton, is thrown aside. By the Haskell and Risdon plan, this could be reduced at a cost of \$40 to \$50 per ton. The necessary fluxes are on hand, and can be procured for simply the expense of hauling.

Nevada County—

From the *Gazette* we gather the following items: Twenty-five men are employed in the Cozeus & Garber's cement mine and mill, near Red Dog. Seventy-five tons of cement are taken out and crushed every twenty-four hours. With the present imperfect means of saving the sulphurets, however, the mine is not paying as well as some others of the same kind. The loss by the destruction of the hoisting works of the Curtis mine is estimated at between four and five thousand dollars. The fire is supposed to have been the work of an incendiary. The Banner mine has only been worked about a year, and during that time some 3,000 tons have been crushed, yielding between thirty and forty dollars a ton, and the cost of mining and milling has not exceeded ten dollars a ton. The company now have a mill of their own, near the mine, and the cost of hauling will hereafter be saved. This mine carries the largest body of uniformly plying ore of any in the county, with the exception, possibly, of the Eureka, and it improves in size and quality of ore as it developed downward.

The *Gazette* says that the "Arabian Nights" is a tame reading by the side of the wonderful mining stories that the *Transcript* tells. The latter stated, for instance, that the Talbot mine, in Willow Valley, had yielded enough to pay for its hoisting works, etc., while the fact is that the cost has been \$19,000, but the yield only \$13,000. Its owners are not "on the sell," and themselves make the correction.

The Grass Valley *National* of the 13th inst. has these items: We note the erection of a new mill on Wolf Creek. The works are being put up by a San Francisco company, who design introducing a new process for working quartz. They propose to rely entirely upon custom work. The rock is to be softened and desulphurized by superheated steam, and then treated in the ordinary manner with stamps and pans. At Sebastopol, the American company, composed of Crall, Swan & Co., are now engaged in putting up a 10-stamp mill for the purpose of crushing the cement with which the claims abound. W. B. Harrington, who came to Grass Valley about two weeks ago, from Austin, and has since been prospecting, strack a ledge six miles south of that place, which is two and a half feet in width. He has since sold the ledge to S. R. Braanon, for \$6,000 in gold coin.

The *Transcript* says: Merrow & Co. have struck cement in their gravel claims at Scott's Flat. The claims in that vicinity have been exceedingly rich, but great difficulty is encountered in working them in consequence of the light grade of the creek. We learn that the Spring Mill mining company, near Nevada, Capt. Day, superintendent, struck very rich rock on Friday last. The company has been at work about eight months, and expended about \$60,000.

It is said that the San Francisco parties who recently purchased a quartz ledge in Wood's Ravine for \$11,000, proceeded immediately to crush a lot of rock, which had been taken out previous to the purchase, and realized therefrom \$13,000. An extensive field of rich gold surface and bank diggings exists near the Old French Cabin, on Grouse Hill, a short distance from the new town of Paris, Nevada county. The new 20-stamp mill of the

Union Hill Mining Company was expected to commence operations on the 16th inst.

Excelsior.—The Meadow Lake *Sun* says the Excelsior company have the frame for their new mill up, and will have it inclosed in a few days. The mill will probably be in operation in a month or six weeks. The *Gazette* gives these items:—A joint stock company has been organized at Meadow Lake for the purpose of erecting a quartz mill to do custom work. The capital stock of the company is \$15,000, divided into six hundred shares of twenty-five dollars each. The mill is to have ten stamps, with sufficient power to run twenty, and to be completed within sixty days after the contract is signed. The owners of the Enterprise mine, in Meadow Lake township, have incorporated in San Francisco. One lot of ore has been shipped to Swansea, Wales, for reduction, and the owners are now having more selected for the same destination, upon which they receive an advance of about a hundred dollars per ton. What is needed now, is a process by which the rock can be reduced and the gold separated, at a reasonable rate, and at the mine. We were shown yesterday some specimens from a ledge recently discovered, situated seven or eight miles from Meadow Lake. The rock is filled with sulphurets of a yellowish color, and it is said to resemble the rock from the Excelsior ledge.

In the issue of the 10th inst., the *Sun* says: We have one mill of eight stamps; two of five each, which are completed, while we have one of twenty almost completed: one of five now being erected; and our citizens are making strenuous efforts to put up another to do custom work. This mill will undoubtedly not only be put up, but will be running within the next sixty days.

The Marysville *Appeal* of July 17th, says: Two of our citizens who took up residences at Meadow Lake, have returned. They do not speak of the present prospects of the town in a very flattering manner, and say that the town and its population is far ahead of the development of the mines.

Placer County—

The *Stars and Stripes* of the 18th instant has these items: Messrs. Millette & Hovey will start up the steam mill on their ledge in Baltimore ravine about the first of August next. They have eight stamps, but will only run four to commence with. Their rock looks well. The shaft on the Taylor ledge is now down to the depth of nearly a hundred feet, and the rock is increasing in richness. Work has been resumed on the Conrad ledge, and specimens recently taken from it are quite rich.

We quote from the editorial column of the same: "It has been suggested that a number of citizens should undertake the development of some fair looking ledge, each contributing a certain sum weekly, until the mine is opened to a moderate depth, and thoroughly prospected by working tests. * * * By this means we can easily demonstrate the value of our mines; and when once we have established their character for permanence and richness, we will have no further trouble for lack of capital."

Plumas County—

The Quincy *Union* of July 11th has the following: The Crescent company are still running one of their mills on Plumas and Premium rock. The new mill is crushing rock from their main ledge. Both of the mills are doing well. The Round Valley mill is running day and night, crushing quartz from the Kittle ledge of Kellogg & Judkins, in Cherokee ravine. The rock is averaging about ten dollars per ton. On Hopkins' Creek, O'Neil, Coyle & Co. have commenced cleaning up, and their claim is paying beyond expectation. Dodge & Co's claim, at Last Chance, is also paying well. Northman & Thomas have commenced cleaning up, and have taken out \$1,200 in three weeks. James Cox has the best claim in the county. Mr. Betts & Co's claim, at Turkeytown, is paying well, and they think they have a big thing. The North Star company are still driving away at their tunnel under Blue Nose.

On Poorman's Creek the miners are all doing well. Gibbons, Henley & Co. struck it big in the creek last week. Turner & Co's claim is paying well. James Gentry intends to commence cleaning up next week. Tom Moore & Co's claim has not been paying very largely of late. Riddle & Brown have a good claim, one of the best on Poorman's. They have not commenced cleaning up, yet they strike a piece now and then. The Diamond man takes out a nugget of thirty-five or forty dollars occasionally.

At Saw Pit Flat times are lively. The mines have all paid well with the exception of the Franklin. The New York has paid beyond the expectation of the shareholders. The Monitor company's claim has paid well. The Union has commenced washing up for the third time since spring. On the first run they took out about seventy-two ounces, sixty-six ounces on the next day, and did not clean the ground-sludge at all. The Eagle company will wash up in a few days.

The boys on the river are all busy putting in

their flumes and wing-dams; not an idle man about, or one to be hired. I think that men who want work would do well to come here.

Shasta County—

The *Courier* of the 14th gives these items: Returns from Big Central rock sent below give an assayed value of \$140 per ton. We know of a dozen lodes at South Fork that will go over \$100 to the ton, and we prophesy that within three months the steamers from Red Bluff will go down loaded with ore from there. The Crystal Company, of South Fork are down twenty-five feet, where they find rock much superior to that on the surface. They are progressing with high hopes of rivaling the Chicago. The Potosi is paying at least \$85 per ton in free gold, and a large amount of sulphurets, the value of which we know not, but are assured by those who claim to be judges that the money in them will carry the value of the lode far beyond \$100 per ton. Recently the Chicago Company sent to San Francisco some twelve or fifteen hundred pounds of their rock to have it worked. The lowest assay had was \$125 per ton. The highest was a working test, a la Swansea, of thirty pounds, which yielded at the rate of \$654.25. They have learned further that the rock cannot be profitably worked by milling. It must be smelted.

Siskiyou County—

From the Yreka *Union* we clip these items: We learn by Mr. Blaskie, of Cottonwood, that extensive placer diggings have recently been discovered about eight miles from that place, on the west branch of Cottonwood Creek. But two claims have been opened, and they showed the ground to be very rich. The prospecting is becoming very lively, and the ground for some distance up the creek has been taken up.

Tulare County—

The Visalia *De'ta* of 11th of July, says:—We learn from Dr. George, who has just returned from Kelso Cañon, that mining matters in the Mt. Sinai and Pi-Ute Districts are progressing satisfactorily.

Mr. W. Roger's Mill is running, and test results are highly gratifying to the owners. Pettis & Co. are proposing to put additional stamps in their mill, and to push the development of their mines. Atchison & Co. have purchased a portion of the first leads found in the Pi-Ute district for \$16,000, and find upon sinking the claims they get better and better.

Tulahoma County—

The *Courier* says:—A 15-stamp mill of the best style has been erected near the main vein of the Sonora Gold Company, and the refuse quartz—the accumulation of years—is now being crushed. We are not informed as to the yield of the quartz, but the work is being pushed ahead. It is decidedly a pocket vein, and has been worked some twelve years by hand, only the richer portion of the rock being crushed by hand mortars.

Yuba County—

The *Appeal* says:—

The Pennsylvania Company, Brown's Valley, cleaned up on Saturday, after crushing seventy-eight tons of rock as it came promiscuously from the ledge. The yield was \$23 per ton. The ledge is from ten to twelve feet in width. The Rattlesnake Company (old Yuba) resumed work yesterday.

At Snartsville, we understand, several persons from Grass Valley are contemplating the erection of a mill and hoisting works for the purpose of working a ledge. The Blue Gravel claims at Smartsville are said to be paying largely at the present time. A number of persons are now engaged, at the latter place, in running a tunnel to prospect a gravel claim which is supposed to be immensely rich. It has been estimated that the tunnel will cost, when completed, nearly \$100,000.—*Grass Valley National*.

NEVADA.

Washoe—

The *Enterprise* says: The daily yield of the Kentucky mine is about thirty-five tons, the largest portion of which is worked at the New York and Manhattan mills, Washoe Valley. The richest of this ore, however, is carefully selected, and sacked up, for close working by the best processes known, and assays from \$800 to \$1,000 per ton. Some ore has just been struck at the 368-foot level that assays even better than that. Fifty men are now employed in and about this mine, the most of whom are engaged in sinking the main shaft still deeper. The width of the Comstock at this point is sixty-six feet, and the ledge dips east at an angle of forty-two degrees.

Reese River—

The Nye County *News* says: The mines of Twin River are opening up splendidly. A large force is at work upon the mill for the Murphy company, which is expected to be ready for operation about the first of October. With a road over the summit from Ophir Canyon, the travel and business of this section will be greatly increased. We learn that the Great Eastern claim, located at Grantsville, distant about ten miles from town, and in the south part of this (Union) district, has been sold to the Knickerhocker Nevada company, who have a fine 20-stamp mill in opera-

tinn, about three miles south of town. It is the intention of the Knickerbocker company to put on a large force to get out ore for the mill, which they will commence working as soon as they finish a quantity of custom rock now on hand. The first stage going west of the Wellington line, carried the first shipment of bullion from the Knickerbocker mill. The amount shipped was 166 pounds. Our bullion will now be sent direct to San Francisco, while heretofore it has gone the round about way of Austin.

From the *Reveille* we clip these items: We saw this morning at the assay office of J. R. Murphy, a novelty in this silver district in the shape of a copper bar. It weighed forty-three ounces, and was obtained from sixty ounces of pure red oxide of copper from the Troy ledge, Battle Mountain district. Work is now carried on upon two of the ledges belonging to the Empire & Silver State M. & C. Co. These are the Tellie, in Marshall Canon, and the Fairview, on Lander Hill. From the Tellie an exceedingly rich class of ore is taken, specimens of which assay at the rate of several thousand dollars per ton, and the entire ledge pays one hundred dollars and upwards. The hoisting apparatus of the Buel North Star is completed, and the work on the mine will be resumed. A whin is being erected on the Asteroid. The incline is 180 feet deep. Indians are becoming insolent in the Hut Creek and Philadelphia districts. The depth of the incline on the Providential is 340 feet. The Savage is constantly at work. In the Morgan and Muncey, a large frame building has been erected over the mouth of the main incline and the preparations for resuming work are being pushed ahead with great vigor. The original incline, which followed the curves and undulations of the vein, has been put in shape for easy and economical work. The incline is substantially timbered on its sides and roof to its greatest depth of 300 feet. The machinery will be completed and put in operation in the course of next week. The incline in the Stephen A. Douglas, has reached the depth of 230 feet. At that point a break occurred in the ledge, and a level is being driven into the hills to recover it.

Esmeralda—

The Union of the 14th inst., gives the following items: The Pahdet District will soon create a lively stir in mining circles. Yesterday A. J. Rhodes and a son of Dr. Fitzhugh arrived in town with several mules packed with some of the finest ore we ever had the pleasure to behold. It is to be sent to San Francisco for reduction. The ore is of a greenish color, with streaks of blue sulphurets running through it and particles of bright yellow gold sparkling all over it. The Pahdet district is situated thirty-five miles due east of Aurora. On last Saturday a deed was placed on file in this county signed by Frederick Collier, President pro tem of the Real Del Monte Company, conveying to W. C. Ralston the two fine mills belonging to the company in this district. The condition mentioned in the deed is \$100,000. A grand uprising of the Indians is feared in Silver Peak District.

The shaft at the mouth of the Discovery tunnel, of the Philadelphia company, had reached a depth of a hundred and twenty-four feet, and was still going down at the rate of over thirty inches every twenty-four hours. The engine and most of the machinery are already on the ground, and will be put up as soon as possible.

Humboldt—

Correspondent of the *Register*, at Dun Glen, July 2d, says: The Monroe company intend to erect a mill. The Humboldt River G. & S. M. Co. has several men at work on the first south extension of the Monroe, where the ledge is found, with good prospects. The same company employs eight or ten men in the vicinity of Barbersville, on various ledges. In McCann Canon are six men at work on the Pauline. Shaft fifty feet down—ledge four feet wide. Ore assays \$800—have had some worked. The Glen is taking out splendid ore. The Humboldt River Company has a considerable force of men at work. The Ophir lode, on the Empire series, presents a very favorable appearance. The old shaft has been sunk to connect with the main tunnel, which gives good ventilation to the mine. The aggregate of shaft, tunnel and drifts in this vein is about 500 feet. Essex tunnel is now in 300 feet. The Tellulab will soon resume operations.

Black Rock—

The Marysville *Appeal* says: Accounts from the Black Rock mining district continue favorable. The *Sage Brush* mentions the working of ore at Dall's mill, which was taken from the Eureka lode at a depth of 50 feet, that yielded a fraction under \$44 to the ton. It seems to be established to the satisfaction of those interested, the lodes of that vicinity may be profitably worked.

Pahranaagat—

The Gold Hill *News* says: Colonel U. E. Allen writes from Silver Canon, Pahranaagat, June 24th, "that the mines here are richer

than any yet discovered in this State, although but little prospecting has been done up to the present time. Yet mark my words, that in one year or less, this district will roll out silver bricks in quantities sufficient to shame the Comstock in her palmiest days."

ARIZONA.

The *Alta's* correspondent at Prescott, says, May 25th: The Galeña lode is a large, fine looking vein, prospecting and opening well. Eight men are at work here in two shafts, from which about seventy tons of ore have been taken up to date (shafts about fifteen feet deep only). The Galeña is situated on the mountains about two miles north of the mill. The Big Bug, situated about one half mile from the mill, is also on the mountains, and on the boundary separating the two classes of veins. Some beautiful ores of a singular character are taken from this mine. The shaft is some fifty feet deep. About fifty tons of ore, some of it very rich, have been taken out this year. Of the Eugene, I can say nothing now, further than that it seems to be of enormous size, and that it is, or can be, worked with great facility, being only one half mile from the mill, and on nearly the same level. Only the surface ores will be available now, of which there are a great abundance. Mr. Rogers is working a small, but rich vein, about a mile from the mill. Woolsey's water mill, five stamper, will be running in a week or so, crushing rock from vein similar to the Jackson. On Lynx creek, (Walker's), Tyson is opening the Gencho vein. They are now down only about twenty feet. The ore is good, and I am told is still improving. On the Occidental we hear to day that they crashed in their pony 2-stamp mill, three tons of ore which yielded \$1,100. This is a very small vein, but is reported to be very rich and to be widening out. A few hundred yards above Berger's mill, four men, who made a flume to bring the water to a little gulch, washed \$300 last week. There are a good many such places.

Same, under date of June 10th, has the following: We may surely say there is a continuous range of gold bearing rock from near Wickenburg to ten miles north of Prescott, and from the Lower Hassimipa to the Agua Frio; which would embrace an area of at least 100 square miles. The containing rock is nearly the same in this entire section. Some fine ores were lately brought in from a new locality, directly on the Agua Frio, about thirty miles in an air line south of Prescott. There are copper ores, which prospect well for gold. The discoverers have gone out again to prospect for placers. This is a slow country to get around in, unless a man has a big pile to pay his way. I have, however, seen enough to satisfy me that this is either a huge country or an unparalleled hulk. Without time and money not much can be done; still my opinion is very favorable.

OREGON.

A letter from the North John Day mines to the *Dalies Mountaineer*, of July 16th, says: Burnt river and Olive creek draw their head waters from the same mountain chain—the first flowing to the east into Snake river; the latter being the John Day. All about the heads of these streams are rich and very extensive gold washings, as yet but partially developed. On Greenhorn gulch, an affluent of Burnt river, the depth is from six to fifteen feet, and on Rose and Quartz gulches, which empty into Olive creek, it varies from ten to fifty feet. Prospects are obtained from top to bottom, and seventy-five cents to the pan has been found thirty feet from the bed rock on Quartz gulch. There are about one hundred and fifty miners on the head waters of Burnt river; and twice as many more on Olive creek and its gulches. Granite creek has about one hundred and twenty-five operative miners. There are two or three small companies working on Clear creek, below the mouth of Bull's Run. Olive creek diggings are fully as good as those in the Boise Basin, and even more extensive. The chance to get hold of good ground is incomparably better.

A reliable gentleman who has just returned from the Middle Fork mines, expresses the opinion that with another season these mines will give employment to from two or three thousand men. The fact is established, that a good mining district has been discovered. The placer diggings are extensive. The Columbia river was rapidly rising for the third time this season.

IDAHO.

The *World* of June 30th, says the emigration from the Boise Basin to Montana is again on the increase, the giving out of the water in some localities having set the miners free to go "prospecting." It speaks of the folly of thus leaving a "good camp" for an uncertainty, and quotes from the letter of an Idaho miner in Elk City: "Miners who intend coming up here to work for wages, will do better to try Placerville, Pioneer City, Idaho City, or all of these places first, and if they can get from four to five dollars per day, they had better stay and work in preference to traveling

over a hard road all summer, and running the risk of getting no employment at all.

The *Olyve Ardenche* of July 7th has these items: The Cosmos company have their whin completed at the original shaft on the Silver Legion; also a bulging house near the center shaft at the head of Wade's gulch. They are taking out a great deal of rich ore at the center shaft, and are increasing the force of laborers as fast as they can be used to advantage. The War Eagle Silver Mining company have let a contract to sink a shaft on their ledge—the Revenue. Twelve thousand dollars in bullion was the result of the last cleanup by Messrs. Moore and Fogus. The Poorman company have several men employed on the road from their works.

A dispatch dated July 1st, from the volunteers who went out to fight Indians, announced that the party (of 32) had fought 250 well mounted Indians for two days and one night, and were in a very critical condition. Six hours after the receipt of the dispatch every citizen that could be armed and mounted was en route for the battle ground, fifty miles from Silver City.

Same paper has seen a specimen of ore from the Sonora ledge, Altara county. It contains several flakes of pure gold, as thick as common window-glass, two inches long by one inch wide. We quote: "There is only one seam of this pure stuff. The ledge is said to be well defined and seven feet wide, and all the ore worth \$60 per ton. We also were shown some specimens of silver ore from the Atlanta ledge, in the same district. It looks very rich and is from a big vein. Col. Preston is owner in each of the above ledges.

MONTANA.

In White's gulch, a short time since, at No. 2, below Discovery, John Bristol cleaned up from a run of ten hours, with four hands \$1,265. A 20-stamp mill is to be erected by John Rogers in French gulch. Miner's wages in Alder gulch are still \$6 per day. There was a rush for the new diggings at Harmony gulch a few days ago. The Missouri is very high. Passengers and freight continue to arrive at Fort Benton. The market will be glutted with goods of all kinds, and those who can buy to hold till spring, will undoubtedly coin money.

COLORADO.

From the *Journal* of June 26th we clip the following items: A lot of Rochdale ore is to be tested at Keith's. If satisfactory, the company will put up a Keith furnace and go to work. The Bertola mills are soon to be started. Some parties are sinking a shaft on a new lode in the lower edge of town, called Vanderbilt. At thirty-five feet in depth they have a crevice about three feet wide, eight inches of which is lustrous ore, assaying richly in silver and gold. The Consolidated Gregory mine is being got into shape now with rapidity. The main shaft is now finished to a depth of 260 feet. The levels have been started, one of which is in seventy feet. Considerable ore is being taken out. The Osceola mill is to be started as on rock from the Quincy lode. A quarter of a pound of ore from the Belmont produced forty-eight cents worth of silver, over a blacksmith's forge. Experiments with Prof. Wertz's sodium amalgam are making here, and the indications are that its use will be found highly advantageous. We are told that the yield of the Narragansett mill was increased in its last week's run by its use more than thirty per cent. A wagon load of ore from the Texas lode produced 23½ pennyweights of gold. Mr. Du Bois has his new mill all enclosed, the furnace finished, and the stack more than half finished. At the Keith mill they are again heating up. The B. H. company have begun to excavate above their new mill for a Keith Furnace addition. The furnace of the Hope company is running steadily, and we believe giving satisfaction. Plummer's mill will be started as soon as the boiler arrives. The Chicago company are setting up one of Fuller's lead machines. The South Park Mining and Exploring company has purchased 2,000 feet on the De Marcy lode, and raised a fund for a working capital. They will go to work at once.

Editorial of same paper says: We do not think there is a prospect of more stamp mills starting. It is now known that they are worse than nothing, because they save so little of the value of the ores while rapidly exhausting the mines. We must depend on some other process. * * The Sierra Madre works, which contemplate the smelting of the gold, silver, and copper into a mat, will ere long be in operation. The Ford Mining company is rapidly completing smelting works on the same plan as Lyon's, we believe, only of smaller capacity. Each of these has a different machine for cutting ores, of which, from what we have seen, we are inclined to give the preference to Colom's, adopted by Mr. Ford. The Clark-Gardner company is also erecting smelting works after the Lyon pattern. Furnaces are being erected by at least three companies in the Georgetown and Snake River silver mines. Experiments are making in Nevada

by Beverly & Company, and we think the King company is looking in the same direction. It is possible that both of these latter are now building works. All of these it is our belief will be worked to profit when once thoroughly going, especially if provisions and everything else in price as seems probable, nay, certain. The Consolidated Gregory, the Corydon, the Benton and the Sisty, can still pay expenses, and will not stop their mills.

BETTER THAN A GOLD MINE.—Out back of the Mission Dolores in this city, and just above the Jewish cemetery, is an isolated hill which is composed of soft red rock, the material most used in macadamizing the streets of San Francisco. This hill is being cut down for the material, and yields its owner \$400 per month upon a contract with a second party, who, in turn, makes \$75 per day from it, getting fifty cents a load for every cart-load hauled away. There is enough of material left in the hill to last for years yet.

How to MELT STEEL WITH AN ORDINARY FIRE.—First heat a piece of steel red-hot, in the fire; then take it up with a pair of pincers, and in the other hand hold a stick of sulphur, which you apply to the steel. As soon as they touch each other, the steel will flow as if it were a liquid.

American and Foreign Patents.—Letters Patent for inventors can be secured in the United States and foreign countries through the **Mining and Scientific Press Patent Agency**. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

San Francisco:

Saturday Morning, July 21, 1866.

GOLD SAVING EXPERIMENTS IN AUSTRALIA.

The great loss of fine gold in the ordinary manipulations of gold ores, is fully recognized by the Australian gold miners, where experiments have pretty conclusively proven that from twenty to twenty-five per cent. of all the gold in the ore is lost, without taking into account the loss from imperfect working of the sulphurets. The current of water introduced into the battery, and sent through the various contrivances for bringing the gold into contact with the mercury, in the process of amalgamation, keeps a large portion of the very fine gold constantly afloat, nearly all of which passes away with the water and pulp.

In numerous experiments made with ore from Steiglitz, Ballarat and the Ovens, by Rev. John J. Bleasdale and Count John Dembinski, and several times repeated, to avoid mistakes, the samples were taken, crushed and divided into equal parts, one-half of which was treated raw, in the usual manner—stamped, ground in Chile mills or pans, and subsequently treated by an amalgamation process, not described in the authority before us; while the other half was roasted and submitted to the chlorine process.

The mean of four experiments showed an increase by the chlorine process of nearly *thirty-eight per cent.* over the ordinary working process, with the aid of mercury.

In order to still further test the loss by working process, other experiments were performed, by mixing known amounts of gold with ordinary sea sand, as follows:

Five grains of gold, made chemically fine, by precipitation, were added to an equal weight of gold in a very fine state of mechanical separation; the ten grains so prepared were mixed with 10,000 grains of sea-sand, and the whole ground to a fine pulp. Several lots were thus prepared, each containing a known quantity of gold. Three lots were then submitted, the one to the ordinary process, and the other to the chlorine process.

The result of one of these experiments, given as an average, was the saving of 3.21 grains by mercury; and 4.62 by the use of chlorine. The difference observable in the two series of experiments is of course attributable to the presence of sulphurets in the one, and their absence in the other.

We have collected the above from a lengthy paper read by one of the parties mentioned, Rev. J. J. Bleasdale, before the Royal Society of Victoria, Australia; the entire series of experiments is but an accumulative amount of evidence of the wasteful process of gold working, usually employed in all gold mining regions.

DROWNED.—Scott Knox, an interesting lad of nine years, was drowned in the Sacramento river, near the Sacramento City Gas Works, on Thursday of last week. While bathing with other boys, he got beyond his depth, and being unable to swim, was carried down by the strong current and lost. His body was recovered on Saturday, five miles below the city. The funeral took place on Sunday. His father, A. C. Knox, Esq., corresponding agent for this journal, was suddenly called by telegraph from Nevada City, to his desolated home. The afflicted parents will receive the heartfelt sympathy of all who knew the departed boy.

SULPHURETS AND THEIR VALUE.

An increasing degree of interest is beginning to be felt in saving and working sulphurets. There is no doubt but that a large portion of the gold contained in our quartz veins has heretofore been suffered to run to waste in the sulphurets, with which it is so closely combined as to defy all ordinary mechanical means for separating it. A few of our mills have for several years adopted some rude process for separating the sulphurets from this great mass of the pulp, and many have saved their tailings by running them into large reservoirs or heaps for future treatment.

Of late quite a number have introduced "separators," chiefly such as are furnished by parties who advertise their machines in this paper. These machines are cheap, simple in their construction and working, and quite effective in separating the sulphurets from the mass of the pulp, which without some such contrivance must be allowed to run to waste.

Assays of sulphurets show a yield varying from \$50 to \$500, and not unfrequently over \$1,000 to the ton. The quantity saved by the separators from the mass of rock crushed varies with the character of the ores—some veins yielding not more than one ton of sulphurets in twenty tons of ore crushed; others yielding as high as one ton of the sulphurets in every eight or ten tons of rock. Of course the sulphurets, as saved, contain more or less of the rock—silex, from fifteen to thirty or fifty per cent.; it is not necessary or desirable even that they should contain less than about thirty per cent. of silex, as the presence of about that quantity greatly facilitates the process of desulphurizing, or "roasting," as it is more commonly expressed.

The sulphurets from any given vein usually run very regular in their assay—the mean of three or four assays being generally considered to determine pretty conclusively their permanent value. Sulphurets assaying \$100 per ton are worth in this city for shipment, about \$50; those assaying \$200 are worth about \$125 per ton. The value of sulphurets assaying a higher rate than \$200 would depend much on the more or less refractory nature of the ore, which would involve a greater or lesser percentage of loss in working it.

During the past week a subscriber to this paper, who owns a quartz mill in the northern part of the State, and who has been working his mine for several years for free gold only, saving nothing of the refuse but his blanket washings, called upon us to have some of his sulphurets assayed, having noticed that we had advised quartz mill owners to pay more attention to that portion of their ore. The result of the assay was \$1,103 to the ton of sulphurets entirely free from sand. Our friend was perfectly astonished at the result, and informed us that by the aid of the machinery recently devised for that purpose, he could save a ton per day of sulphurets, nearly as clean as the sample he had placed in our hands for assay. He has thus been running away more gold than he has saved for the two or three years past! He will hereafter profit by the lesson he has learned by reading the **Mining and Scientific Press**. This, of course, is an exceptional case; sulphurets usually assaying from \$75 to \$150 to the ton. There is no trouble in saving them, and no mill should be without its concentrators.

With regard to working sulphurets, the process generally adopted, at present, is that known as the "chlorine process." The various methods of treating sulphurets are discussed at considerable length in the **Mining and Scientific Press** for December 9th and 23d, 1865. The subject is too extensive for any special consideration at this time, although we shall endeavor to speak more fully of it at an early day.

A cheaper, more practical and more thorough mode of treating them than any now employed, is at present a very desirable object to the mining interests of California. Experiments are now in progress in this direction, which we feel quite confident will soon result in something practical and important. When

anything of special interest is arrived at in this direction, we shall lose no time in laying it before our readers.

SULPHURETS IN CEMENT MINES.

It has recently been discovered that many of our gravel cement mines also contain quite a notable amount of sulphurets, and several of the mills in the neighborhood of You Bet, Nevada County, are putting in appliances for saving them. We are not informed with regard to the character of these appliances; but from what we have heard, we should judge them to be quite inferior to the machinery now being manufactured for that especial purpose in this city.

Without any intention to underrate the actual value of the recent interesting discovery, that paying sulphurets can be collected from the mills in various parts of the State engaged in crushing cement, we must still persist, notwithstanding we have been called to account for so doing, in assuring our readers that the statements in some of the newspapers—the *Nevada Transcript* in particular—are altogether as have yet come to light. We notice that even the contemporaries of that paper are calling it to account in this relation. Nothing is gained in mining matters by overruling such interests. Capitalists have been so often deceived of late in such matters that they are now becoming over-cautious; and as we desire their aid in the development of the mines, we should endeavor to keep as near to facts as it is possible to do in matters of so much uncertainty as those pertaining to mining.

We have been assured, during the past week, by several intelligent, practical cement miners from the vicinity of You Bet, that our statements with regard to sulphurets in those mines were as near the truth as it is possible to arrive at the present time.

Our advice to both quartz and cement miners is, that they should first take steps to test the value of their sulphurets, by careful assays, and whenever they prove valuable, that immediate measures should be taken to save them. They will readily command their full value, either at Nevada, Grass Valley, or in this city. The probability is that there will be found quite as much difference in the quantity and quality of sulphurets in the cement mines as in quartz mines. The value of these sulphurets can be readily ascertained. The machinery for saving them is within the reach of all, and concentrators may be obtained for from \$200 to \$300.

BUSINESS COLLEGES.—The time has come when a business education is indispensable. A classical education fits a man for the study of a profession. It cultivates and polishes the mind, and wears off the rough edges of a man's character, but it sends him into the world as ignorant of business as a babe. What he lacks, however, is a business education, and then he can make his mark. This want has long been felt by business men and educators, and it is now met by the establishment of Business Colleges. These new institutions have been improved from time to time, until they are now so conducted that the *theory and practice* of business life are united; and the student gains the advantages of both. Young men can enter them from the workshop, the counting house and the farm without previous training; and no young man should fail of spending a few months at one of them. He can thus fit himself for a successful business life. By the exercise of *modesty*, perseverance and energy, he can soon leave his uneducated fellows far in the rear. In connection with these thoughts we take pleasure in recommending the Pacific Business College, situated at 751 Market street. Students are received at all seasons of the year, and each one receives the special and personal attention of the teachers; and on the completion of his studies receives a diploma. Mr. E. P. Heald is President of this association. Among the directors, lecturers and instructors will be found some of our most worthy citizens.

The town of Bristol, in Vermont, has a pill-box factory which employs twenty workmen, and uses up 300 cords of white hick a year.

SUBMARINE BLASTING.

The fact has already been noticed that, in the absence of any aid from Congress, the merchants of this city have undertaken to remove the two snoken rocks in this harbor, known as Rincon and Blossom rocks; both in the direct track of vessels, and constituting serious obstructions to navigation. The first is about 100 feet in length by 50 in breadth, and within about twelve feet of the surface; we are not acquainted with the dimensions of the other.

The work is being done under the direction of T. D. Parkinson. No drilling is required, but the charge of powder is placed upon the surface of the rock, enclosed in an air tight can, where it is fired by means of an insulated wire connected with a galvanic battery upon the shore. The effect is produced by the force of the explosion being communicated to the surface of the rock by the pressure of the superincumbent water, instead of by confining it with tamping, as in the case of drilling.

Three blasts have already been fired upon Rincon Rock. The first consisted of 125 lbs. of California powder, which was placed upon a projecting point of the rock. The effect of the explosion was to throw up a huge column of water, in the shape of an elongated cone, to the height of about seventy feet, and break up the surface of the rock for many feet around to such an extent as to increase the depth of water over the spot ten or twelve feet. The pieces were mostly thrown off into deep water, where they can do no harm. The rock is a hard slate, and not very easy to blast.

The first application of electricity to firing submarine charges was made by Gen. Pesley, in 1839, at Spithead, England. It was employed in removing from the channel the wreck of the Royal George.

The effect of the explosion of gunpowder, under the above conditions, is very much like a blow from a huge hammer. The force, exerted at the instant of explosion, is equivalent to about six tons per square inch upon the surface exposed to the force. Count Rumford estimates the force of gunpowder at about 10,000 atmospheres. The crushing effect of such a blow exerted over a space, say of twenty-five to thirty square feet, must be immense; and it is no great matter of astonishment that the hard rock should crumble beneath the blow, as Rincon Rock is now wasting away under the repeated blows inflicted upon it by Mr. Parkinson.

After that rock is demolished, or put out of harm's way, Mr. P. will commence the same kind of attack upon Blossom Rock, near Fort Alcatraz. Nitro-glycerine would exert a far more destructive effect than gunpowder; but since the late terrible calamity on Montgomery street, the city authorities have refused to allow it to be employed anywhere within their jurisdiction.

BRUCKNER'S ROASTING FURNACE.—The principle of the application of revolving cylinders to roasting ores appears to be reaching a decided success. We understand that one of Bruckner's furnaces, which has recently been put up at the Central mill, near Virginia City, has been in operation some ten days on the first class ore from the Cometock ledge, and with very favorable results. Mr. George Attwood, Superintendent of the Ophir Reduction Works and Central mill, writes to Mr. Bruckner, as follows: "Compared with the old reverberatory furnaces now in use, it consumes less wood, and saves one-half the labor. It also roasts in a shorter space of time. It desulphurizes remarkably well, and chloridizes very fairly."

We don't know of anything further that could be asked for to prove this furnace a complete success, except a continuance to do just what it is now reported to be doing, for a reasonable length of time. We shall watch anxiously and confidently for such continuance of service. The experiment could not have been entrusted to better hands than Mr. Attwood's. The success of this furnace will furnish a very satisfactory solution to the problem for a cheap and successful working of auriferous sulphurets, applicable on a small scale, and to almost any locality.

NEW PATENTS.

Following is a list of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, together with other issues which we deem of local interest to readers on this side of the Continent. Most of these claims have been secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

TATTING SHUTTLE.—A. Dobrowsky, Shasta, Cal.:

I claim as a new article of manufacture a tating shuttle, composed of two sides, A, A, center-piece, B, and pin, C, extending beyond the sides, A, A, at one or both ends, as shown and described.

WATER-WHEEL.—Thomas McAnley, San Francisco, Cal.:

In combination with the water-wheel described, I claim the discharge-nozzle, N, arranged outside of the wheel and the dash-board D, for joint operation, substantially as described.

HITCHING-POST.—Valentino Ward, San Francisco, Cal.:

I claim, 1st, The post or shell, A, sunk underneath a sidewalk or pavement, having an extension shaft or bar, P, to be drawn from or inserted in said post or shell at will, substantially as described and for the purpose set forth.

2d, The spring, E, or its equivalent, when arranged as above described, or by weights and pulleys, when a large post is desired, substantially as described and for the purpose set forth.

FASTENING FOR FRUIT-BOXES.—Henry T. Barker, Napa, Cal.:

I claim the arrangement shown and described, consisting of the headed catch at the slotted end of the lid and the threaded bolt at the other end upon which the lid is screwed by the nut.

OTHER PATENTS OF GENERAL INTEREST RECENTLY ISSUED.

ROCK DRILL.—John Greives, Brooklyn, N. Y.:

I claim the drill constructed of a central polygonal rod with cutting point and angular sectional cutters bolted to the sides of said rod, substantially as herein specified.

LAMP CHIMNEY.—H. C. Appleby, Conneaut, Ohio:

This invention consists in constructing a glass chimney for lamps with corrugations flutings or the like, running spirally around the chimney, whereby the chimney will have a better capacity for expansion, and therefore be less liable to break than ordinary glass chimneys.

TREATING WOOL.—P. S. Haines, Newburgh, N. Y.:

The object of this invention is to facilitate the picking and carding of wool, and also to facilitate its treatment or disintegration by any other machines as well as by means of pickers and carding machines.

DETACHING BOATS FROM THEIR DAVITS.—Thomas Huntington, New Rochelle, N. Y.:

This is an improved means for detaching ship's boats from their davits by the simultaneous detachment of the books of both the front and rear tackle blocks from the boat, so that the latter may be set free upon the water without the liability of being swamped or capized in a swell or sea.

MACHINE FOR PICKING COTTON.—John Griffin, Louisville, Ky.:

The inventor of this machine for picking cotton has already secured several patents for the same object. In this one he secures more power in the picking apparatus; the device is more readily manipulated, so that the work will be less, and prevent the choking or clogging of the cotton in the tube.

PATENTS can be obtained for citizens on this Coast, through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. In one-half the time it takes to operate through Eastern agents. From our familiarity with the subject of most California inventions, and the benefit arising from personal explanations, we are prepared to present claims with greater accuracy than could reasonably be expected of distant agents.

CORRETT'S ORE ROASTING APPARATUS, which we noticed at length in our issue of July 7th, is attracting considerable attention. Most parties who have examined the working model at Mr. Linforth's office, corner of Front and Market streets, have expressed a favorable opinion with regard to its merits. No one interested in ores which require a roasting process, should fail to examine this furnace.

TEA AND COFFEE IN SAN FRANCISCO.—The duties paid at this port on tea during the first six months of the present year were \$218,702; duties paid on coffee for the same time, \$262,572—total for these two luxuries, \$481,274 for six months, a tax for duties alone equal to two dollars per annum for every woman and child in the State.

HUNGERFORD'S IMPROVED CONCENTRATOR,

FIG. 1.

For Saving Gold, Sulphurets, Quicksilver, Etc.

FIG. 2.

have been tried, and many abandoned; all of which have been unable, so far, to attain a profitable separation, and meet the requirement of the mining interest, so well as that now patented by Mr. Hungerford, which is an improvement on the well known Hungerford & Prater Concentrator, with which his name is already so familiar.

The separating or concentrating action is obtained by centrifugal force and gravitation; the pulp being preserved by water in the proper condition for the operation, and the pan so constructed, mechanically, as to allow the centrifugal force and gravity to expend themselves to the best advantage in producing the separation, as well as to make the machine simple, compact, and easily kept in order.

Fig. No. 1 is a perspective view of the Concentrator while in operation, showing the general arrangement. Fig. No. 2 is a section through the centre of the pan, showing how it operates in separating the sulphurets, as well as the great improvement to the pan, which consists of the addition of a circular trough outside the periphery.

Its operation is as follows: The pulp flows from the spout through the filter into the bowl at the top, from which it is distributed equally over the convex cover into the pan near its outer edge. The lightest sand is at once carried off with the overflowing water through the centre opening, and the sulphurets are allowed, from the motion given to the machine, to gravitate to the bottom toward the outer edge, forming an embankment all around the pan, as represented at 1, 1, Fig. 2. The lighter particles of the sand arrange themselves on the top at 2, 2, Fig. 2, from which they are being constantly washed away with the water flowing through the central opening. The sulphurets are, by the centrifugal motion of the machine, made to pass through small openings at the bottom, at intervals of a few inches around the circumference, through the inner wall of the pan to the circular trough 3, 3, Fig. 2, where they come in contact with the mercury at the bottom, depositing the free metal, from which it is drawn at pleasure by an opening in the bottom, and the sulphurets, in the order of their density, by opening in the sides.

It will be observed that the sulphurets in the trough 3, 3, are maintained at the same elevation as the sulphurets and overlying sand in the body of the pan. It will be further observed, that by no possible means can the sand in the latter pass to the former in such quantities as to form any considerable percentage of the amount saved. The advantages of this improved pan are continuous action, requiring no attention except to remove the receiving vessels as fast as they are filled from the openings shown on the right of Fig. 2, simplicity in construction, and durability and cheapness of cost.

The pan derives its motion from two eccentrics secured on a horizontal shaft passing across and below the centre of the pan and working between two pairs of adjustable wooden guide blocks or bearings. The eccentrics are so made as to bear equally on the wooden guide blocks in all positions while in motion; giving to the pan the most desirable motion for its purpose, and doing away with all complexity of rods, cranks, wooden frame, etc.

These pans are now being introduced into the best mills in the country. Reference to parties who have tested them can be had by applying to the manufacturers.

Those interested in mining, and who call at the Miners' Foundry to see the one which is there in operation, will have no reason to regret their visit.

San Francisco, June, 1866.

[3x13 in.]

M. HUNGERFORD,

Miners' Foundry, First Street.

GEORGE E. BROWN,

(Late Assistant Examiner in the U. S. Patent Office.)

HAVING RESIGNED THAT POSITION AFTER A TENURE of office of eighteen months, offers his services to INVENTORS AND THEIR ASSIGNEES;

—AS A—

Patent Solicitor,

He will make Preliminary Examinations in the Patent Office, with a view to ascertain the Patentability of any invention that may be submitted to him for that purpose; will prepare the necessary papers for those who wish to make Applications for

Patents for their Inventions,

—OR FOR—

EXTENSIONS OR REISSUES OF PATENTS

Already granted; will act as an Attorney in presenting Applications at the Patent Office, and in managing them to a final issue; will draw up Assignments; will examine into the condition of neglected Applications when desired to do so, and undertake the prosecution of such as may be considered patentable, and do whatever else is usually done by Patent Solicitors.

Address, P. O. Box 257, Washington, D. C. 7v12-3m

Preparing for Immediate Publication.

ONE VOLUME, OCTAVO.

THE PACIFIC COAST

BUSINESS DIRECTORY!

FOR 1866.

Price \$5 00.

Payable on Delivery of the Work.

CONTAINING THE

NAMES, BUSINESS AND ADDRESS OF ALL MERCHANTS, MANUFACTURERS AND PROFESSIONAL MEN, IN THE States of California, Oregon and Nevada and the Territories of Washington, Idaho and Montana; also, lists of the Commercial, Agricultural, Manufacturing, Mining, Petroleum, Railroads, Telegraph, Banking and Insurance Companies in operation at the present time in the above States and Territories, to which will be added such other valuable information as will render the work a VALUABLE and RELIABLE MEDIUM OF REFERENCE.

Prepared by the Editor of the San Francisco Directory, State Register, etc.

In announcing the above enterprise, the compiler deems it unnecessary to refer more particularly to its contents. He would state, however, that it shall be his aim to present a work of practical utility to all who are interested in the development of the resources of the Pacific coast. For the fulfillment of this, he respectfully refers to the different compilations issued under his charge for the past ten years.

HENRY G. LANGLEY, Publisher.

612 Clay street, San Francisco.

San Francisco, April 19, 1866.

This Press is a large, sixteen page paper, and is truly a valuable assistant to the mining interests of the Pacific Coast.—[Nyo County News.]

ESTABLISHED

[MAY, 1866.]

VOLUME THIRTEEN

—OF THE—

Mining and Scientific Press,

COMMENCING JULY, 1866.

DEWEY & CO., Publishers.

Issued every SATURDAY, at our Book and Job Printing Office, 505 Clay street, corner of Sansome, San Francisco.

Terms in Advance—One year, \$5; Six months, \$3; Single copies, 15 cents; Monthly Series, \$5 60 per year, or 65 cents per number. Back Volumes from January, 1861, \$3 per volume; bound, \$5 per volume.

The MINING AND SCIENTIFIC PRESS is now thoroughly established, and enjoys one of the largest and most permanent subscription lists of any weekly journal on this coast. The individual character and reputation of its constant patrons throughout the entire coast is one of the best recommendations of its merits and value as a medium of intelligent progress and prosperity.

YOUNG MEN WANTED!

Pacific Business College!

751 Market street, between Third and Fourth, SAN FRANCISCO.

AN INSTITUTION DESIGNED TO PREPARE YOUNG and middle-aged men for an active and successful business life.

BOOK-KEEPING, PENMANSHIP, COMMERCIAL LAW, COMMERCIAL ARITHMETIC, CORRESPONDENCE, MODERN, LANGUAGES, Etc.,

Practically taught.

This College forms a link of the

American Chain of Commercial Colleges.

Located in the principal cities of the United States, and is the only institution on the Pacific coast conducted on actual BUSINESS PRINCIPLES.

Regular Banks and Business Offices have been Introduced.

By which we are enabled to fit out Students in the BEST POSSIBLE MANNER, and at the LEAST EXPENSE of time and money, for the practical duties of the Counting House.

Students can enter at any time of the year, there being no vacations. Each student receives individual instruction, with the exception of Lectures and other general exercises.

The College Review.

Giving full particulars of the College, can be had FREE, by calling at the College, or addressing

Pacific Mail Steamship Co's

THROUGH LINE TO NEW YORK,

Carrying the United States Mail.

LEAVE FOLSOM STREET WHARF, AT 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the 10th, 15th and 30th of each month that has 30 days.

On the 10th, 15th and 30th of each month that has 31 days.

When the 10th, 15th and 30th fall on Sunday, they will leave on Saturday preceding; when the 15th falls on Sunday, they will leave on Monday following.

Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.

Departures of 15th or 19th connect with French Transatlantic Co.'s steamer for St. Nazaire, and English steamer for South America.

Departure of 10th connects with English steamer for Southampton, and P. R. R. Co.'s steamer for Central America.

Departure of the 5th connects with English steamer for Panama, the port of the new mines.

The following Steamships will be dispatched on dates as given below:

July 30th—CONSTITUTION, Capt. E. S. Farnsworth, Connecting with ARIZONA, Capt. Maury.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively call at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

For Merchandise and Freight apply to Messrs. WELLS, FARCO & CO.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

Capitalists, Attention!

QUARTZ MILL & MINING PROPERTY

FOR SALE

In Nevada County.

A NEW 8-STAMP QUARTZ MILL, 2 LEDGES AND 640 acres heavily timbered Land, near Eureka, Nevada County, are now offered for sale. The Mill is run by steam power, and is in complete order for business. The ledges, which form the principal value of this property, are all large and well-defined, but require a further outlay of capital, in order to make them remunerative. For the lack of means to properly develop these claims, the present owners are disposed to sell the same for a reasonable price.

Capitalists wishing to engage in mining will find this a splendid opportunity to purchase a property that will bear rigid scrutiny, and offers superior inducements as an investment.

For address and further information, inquire of the Publishers of the MINING AND SCIENTIFIC PRESS, 505 Clay street, San Francisco.

2v12

To MAKE CINDERS, OR LITTLE WICKER-FIGURES APPEAR AS IF THEY WERE CRYSTALLIZED. Saturate water, kept boiling, with alum; then set the solution in a cool place, suspending in it by a hair, or a fine silk thread, a cinder, a sprig of a plant, or any other trifle; as the solution cools, a beautiful crystallization of the salt takes place upon the cinders, etc., which are made to resemble specimens of mineralogical spar.

It is stated that the expense incurred by Canada, in consequence of the Fenian invasion, up to this time, may be estimated at a sum not far short of \$2,500,000, and that sum will be largely increased before the matter subsides into quietness.

A JOINT stock company has been organized at Meadow Lake for the purpose of erecting a quartz mill to do custom work.

Machinists and Foundries.

JOHN LOCHHEAD'S
Steam Engine Works,
Reale street, near Mission, San Francisco.

STEAM ENGINES OF EVERY DESCRIPTION BUILT
to order—Marine, Stationary, or Locomotive.

HOISTING AND PUMPING ENGINES,
PORTABLE ENGINES, OF ALL SIZES,
DONKEY PUMPS, Etc., Etc., Etc.

The attention of the parties engaged in shipping or inland
navigation is called to the

Superior Workmanship
of Mr. LOCHHEAD, who has been in the business in San
Francisco for the last fourteen years, and enjoys the reputation
of having built ONE HUNDRED AND SEVENTEEN
STEAM ENGINES.

Screw Propellers of all kinds, and Steam Boat Machinery
generally, made to order, and warranted to give perfect
satisfaction in every particular. 25v12-3m

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Works, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Bag, Screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.
ENGINES.—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.
ROLLERS. Locomotive, Flue, Tubular, Upright, Cylinder and Cornish, and every variety of Roller Work. All sizes of tubes and pipes for pumps.
PUMPS.—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's improved Trajectory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Veatch's tubs, Prater's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS,** of all sizes.

OIL BORING TOOLS AND MACHINERY.—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of Iron. All work done in the best manner at the lowest cash prices.

H. J. BOOTH, GEO. W. PRESCOTT, IRVING M. SCOTT.

Miners' Foundry —AND— MACHINE WORKS.

First St., between Howard and Folsom Streets,
SAN FRANCISCO.

EVERY description of Iron and Brass Machinery, the
BEST and MOST ECONOMICAL, manufactured in the
State of California, will be furnished with dispatch at the
MINERS' FOUNDRY AND MACHINE WORKS, such as

Steam Engines and Boilers, Flour, Saw and Quartz Mills,
Machinery, Mining Pumps, Amalgamators,
Retorts, Etc., Etc.

Particular attention will be given to the manufacture of
Machinery in Sections designed for places of difficult ac-
cess. Various models of Quartz Crushers, Amalgamators
and Water Wheels—some in operation and on exhibition.
Persons desiring to test their ores practically, in small
quantities, will be afforded ample facilities, free or cost.
All parties desiring accurate and highly finished drawings
and superior Machinery, at most reasonable rates, are cordially
invited to call before contracting elsewhere.

REPAIRED.

Special attention paid to Repairing. 25v12-3m

Familiar Science.

EVERY body who has had opportunities of swimming in sea water and in fresh water, knows that he can swim more easily, and that it is much easier to float in the first than in the last. But it is not every boy that can tell the reason why. It is because salt water is heavier than fresh water. If we dissolve any kind of salts in fresh water, it becomes heavier than before. Hence it is that the water of the Dead Sea in the Holy Land, which is almost saturated with salts of various kinds, is so heavy that it is said to be impossible for any man to sink in it. Almost every boy in the country has witnessed the operation of making brine far pickles. It is usual to put an egg in a vessel of fresh water, in which, if it be a sound one, it will sink to the bottom. Then salt is stirred in until the egg rises to the surface, when the brine is supposed to be strong enough. The egg rises because the quantity of water which would fill the egg, after the salt has been added, has become heavier than the egg, which, being lighter must float. If we put oil in a vessel with water, the oil will float on top, because it has less specific gravity than the water. Now fresh water can be made to float on salt water for a time, until the salt from below has time to diffuse itself through it, and make all parts of the water equally salt. At the same time an egg may be made to float partly in the salt and partly in the fresh water, that is to say, be suspended at the point where the fresh water touches the salt.

This may be done as follows: Take any deep glass vessel; a glass jar, such as is used for confectionery, or for putting up fruit, will be very convenient, and fill it half full of water; put in an egg, and it will go to the bottom. Now make a strong brine, as above described, then take a glass tube that will reach to the bottom of the glass vessel used, and pour the brine gently into this tube, so that it will run down to the bottom of the vessel; as you continue to pour, the egg will gradually rise, being lifted up in connection with the fresh water, until the vessel is full; you will then have the egg suspended midway in the vessel, or at the line of junction between the fresh and salt water.

TO MAKE COLORED CRYSTALS OF ALUM.—Method of proceeding.—Hot saturated solutions of alum are mixed with various coloring substances, and are then submitted to crystallization. Colors to be used:—The addition of powdered turmeric produces transparent yellow crystals. Powdered litmus produces transparent red crystals. Logwood makes them purple, and cochineal writing ink black. The more troubled the solution looks, the finer are the crystals it affords, so that filtration is not necessary. These colored crystals are more easily destroyed than those of pure alum. The best way to preserve them is to support them under a bell glass, which rests in a capsule that contains a little water. This arrangement produces a moist atmosphere, which is not only useful in this case, but also for the preservation of crystals of sulphate of copper, and various other salts whose colors are dependent upon their water of crystallization.

The crystallization of alum is promoted by hanging in its solution substances with rough surfaces, such as coke, cotton, porous wood and pumice stone.

INSTANTANEOUS CRYSTALLIZATION.—A Curious Example of the Production of heat by the Conversion of a Liquid into a Solid.—Into two ounces of boiling water, put as much sulphate of soda as it will dissolve (about three ounces). Pour as much of this saturated solution, when boiling hot, into a phial, as will nearly, but not quite, fill it; cork the phial closely, and let it stand to cool. When cold the solution is still fluid; but the instant you draw the cork a very beautiful but confused crystallization of the whole mass immediately takes place; and at the same time, so much heat is evolved as to make the phial warm.

The explanation of the experiment is this: Water dissolves more sulphate of soda when hot than when cold; and cold water dissolves more in proportion as the pressure of the atmosphere is diminished. The hot water is then saturated, and if it had been suffered to cool in an open vessel would have deposited part of the salt. But in this case none is deposited, for by suffering the solution to cool in a close vessel, a partial vacuum is produced at the surface of it, (the steam which occupied the top part of the phial when the cork is inserted, being by the subsequent cold condensed), and the water, when cold, is thus enabled to hold in solution all the salt which it had dissolved when hot. As soon, however, as by drawing the cork, you admit the usual pressure of the atmosphere the cold water is rendered incapable of holding so much salt in solution, and part is therefore instantly crystallized. The heat which is evolved is the heat of liquidity of the portion of salt which thus becomes solid. If when the salt has crystallized you plunge the phial containing it into hot water, it will be again dissolved. You may then cork the phial as before, for future use.

THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequalled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call special attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully solicited.

Eyes! Eyes!! Eyes!!!

DR. HENLY, Oculist and Aurist, HAS received from Scotland one of the most MIRACULOUS REMEDIES for the benefit of the HUMAN EYE ever before discovered. It is unparalleled in its effects upon the diseases incident to this organ. It gives wonderful power to the optic nerve, and removes all the granulations from the lids, and all mucous film from the sclerotic coat without the use of instruments. In fact, it works like a charm on the Eye, without giving any pain. You feel the effect of the medicine in different parts of the head. It drives the disease back into the system, which is better able to stand it than this tender organ.

Why will you suffer when you can be cured in a few days. Persons who have been blind for ten years have been restored to their sight in a short time by the use of this medicine. I will treat any person's eyes in the State, and if I do not give them relief in a short time, I will not charge them anything. Office, No. 751 CLAY STREET, opposite the Plaza, San Francisco.

13v12

Rheumatism !!

READ IT! READ IT!!

SACRAMENTO, April 16, 1868.

H. BOWMAN—DEAR SIR: THIS IS THE FIRST WRIT-

ing I have done in two years, and it affords me great

pleasure to be able to use my pen in the service of those who

are suffering, as I have suffered, by stating the following

facts:

I have for two years and upwards been afflicted with

CHRONIC RHEUMATISM, and until a few weeks ago I

have never found anything that afforded me any relief.

For three months of the time I was unable to feed myself,

and for the last five months my arms have been so bent

that I have not been able to dress myself. I was five months

at Warm Springs, at San Luis Obispo, and three months

at a Hydropathic Institute in Stockton, and I have been

under the care of six different physicians in the vain hope

of relief. About four weeks ago I was induced by a person

who had been cured by it to try a bottle of RICHARD'S

REMEDY FOR RHEUMATISM, and in less than twelve

hours I experienced great relief. In a few days I was

enabled to straighten out my arms, and I have been getting

better and gaining in strength and flesh ever since. I have

now the complete use of all my limbs, and, for the first

time in two years, I am out of pain. I do feel for those

who suffer as I have suffered, and if they will take my

advice, they will lose no time in giving the REMEDY a trial.

Yours truly,

GEORGE TAYLOR.

RICHARD'S REMEDY is for sale by

H. BOWMAN,

Druggist, Sacramento.

A Rare Chance!

A Splendid Business in Alameda County.

FOR SALE AT A GREAT BARGAIN,

400 ACRES OF LAND,

INCLUDING

Landing, Wharf, Three Capacious

Warehouses,

Capable of holding 12,000 Tons, which amount of grain

was stored and shipped the past year. Connected with

said business there is an extensive Lumber Yard; sales

during last year, two million feet, which sales, and the

entire business, can be largely increased.

The above is a rare opportunity for parties desirous of

engaging in an active business that will pay a large

dividend on the investment. Satisfactory reasons given for

selling, and all information desired can be obtained on ap-

plication by mail, or otherwise, to

G. E. SMITH,

Notary Public and Searcher of Records, Office "Beatty

House," San Leandro.

23v12-2m

BEAUTIFUL FOREVER.

The beauty of youth—a fresh complexion and loveliness of expression is desirable, and has a wonderful value in the estimation of everyone; but, alas! it is one of those things on which is written "eminently perishable." How much more desirable is that ornament which is of great price—a meek and quiet spirit; the highest loveliness of all, lovely because loveable. Such beauty is peculiar to no form, to no age, to no person—it is beautiful forever!

The first seems too generally to be the most coveted—and to be so simply because it is most fleeting. Why it should be so is one of the hidden mysteries of our nature. And yet who is there that does not love with a warmth of affection which mere personal attractions can never inspire, the modest retiring one, on whose linaments we seek in vain for those lines of beauty which fade with advancing years, and whose only claim to admiration is our consciousness of the precious fragrance that ever emanates from a lovely example. Earth seems not to be her home; she has a loveliness far above common humanity.

Follow her through life until she has fulfilled her mission here. Watch her as she steps down to the brink of the dark rolling river. How quiet, how resigned, how happy. As the silver cord is loosed, cannot you almost see, as she sees, the angels coming to hear her way to the heavenly land, where there is neither pain nor sorrow; but joy and gladness evermore!

A WORM PROTECTOR, designed to capture and kill the worms which annually infest the trees of forests and parks and fruit trees, has been invented by F. R. House, of Connecticut. It consists of a tin screen, of bell shape, which is to be soldered around a tree, and suspended on an india-rubber band that fits the bark closely; under the expanded edge of the screen, and concealed, there is a receptacle for oil; the worms in their ascent cannot pass the "protector," but are likely to fall into the oil. This invention has been tested, it is said, with the best results; and it will be likely to supersede the use of the ropes and bands of hay and straw saturated with various substances, which are temporarily useful, but very unsightly.

MORE RICH YIELDS FROM CEMENT.—Brown's claim, adjoining Nece & West's, at You Bet, cleaned up for the three weeks ending with Saturday last, as follows:

Saturday, June 30.....	\$3.500
Saturday, July 7.....	3.240
Saturday, July 14.....	8.000

The expenses of this company are probably not far from \$500 per week, which leaves a pretty fair margin of profit.

NEW PATENT LAW.—According to the new postal law just approved by the President, prepaid and free letters are to be forwarded at the request of the party addressed from one post office to another without additional postage charge; and returned dead letters are to be restored to the writers free of postage.

PATENT OFFICE REPORTS.—The Senate has passed a resolution which will enable the Patent Office Report of 1866 to be issued in 1867, and prevent the usual delay of two or three years.

AN ELEPHANT'S TRUNK.—One has been apt to consider a steam-bammer, which can with one blow exert a force of two tons, and with another break a nut without injuring the kernel, as a triumph of human ingenuity, and so it is. But how insignificant when placed in comparison with the trunk of an elephant; for not only can the latter strike a blow of a ton or so, and break an egg or a nut, but it can pick up a pin from the floor, or pull down a tree, project water with the force of a 20-man power forcing-pump, or uncork and drink a bottle of soda-water without spilling a drop.

A NEW DYE, which promises to be of much commercial value, has just been procured from theine, the principle of tea. Of course, if theine were only procurable from tea, the new discovery would not be of much importance; but inasmuch as the principle exists largely in other plants, it will prove of considerable importance.

City College Laboratories,
Southeast Cor. Stockton and Geary sts.
Practical and Analytical Chemistry
and Metallurgy.

THOMAS PRICE,
Professor of Chemistry,
(Formerly of the Normal College, Swansea.)

WILL GIVE PRACTICAL INSTRUCTIONS IN QUALITATIVE AND QUANTITATIVE ANALYSIS AND ASSAYING. The course qualifies students for the application of Chemistry to METALLURGY, MANUFACTURING ARTS, and MINING PURPOSES.

PHARMACEUTICAL and TECHNICAL CHEMISTRY, such as is required by Medical and Pharmaceutical Students, will be taught to such students as may require it.

Course of General Chemistry.

Evening Lectures will be delivered every Tuesday, at half-past seven o'clock, P. M., in the Philosophical Hall of the College, without extra charge to the students in the institution.

On and after the 14th of February, the Laboratories will be open every day, except Sundays, from 8 A. M. to 5 P. M. For further particulars, address

VALUABLE MINES!
FOR SALE
IN NEVADA COUNTY.

FOUR VALUABLE QUARTZ MINES, SITUATED AT THE base of Deer Mountain, and about equi-distant from Grass Valley and Nevada City, are now offered for sale. These ledges run parallel with each other, are wide and well defined, varying from fifteen inches to four feet in width, and have been sufficiently developed to prove them to be of great prospective value. One of them is an extension of the famous Star Spangled Banner. A shaft has been sunk on the extension to a depth of thirty feet, where the ledge is fully two feet wide, and prospects quite as well as the Banner did at that depth. On account of water, further progress downward was impossible without machinery. These claims are accessible at all seasons of the year, and wood and water exist in their immediate vicinity in great abundance. Parties who would prefer putting up machinery and sinking on one or more of these claims, for an interest in them, can do so, and liberal terms will be granted by the present owners.

Persons desiring to purchase claims, or erect machinery to prospect the same, will find this a capital chance. For further information, reference may be had on application to the Editors and Publishers of the MINING AND SCIENTIFIC PRESS, 205 Clay street, San Francisco. 2412

ANNUAL REPORT
—OF THE—
Pacific Insurance Company.

IN COMPLIANCE WITH THE ACT OF THE LEGISLATURE of the State of California, entitled "An Act concerning Corporations," passed April 22, 1860, the Pacific Insurance Company of San Francisco makes the following Annual Report:

I.—The amount of the Capital Stock of this Company is SEVEN HUNDRED AND FIFTY THOUSAND DOLLARS, and paid in GOLD.....\$750,000

II.—The amount of the Assets is ONE MILLION AND FIFTY-ONE THOUSAND, FOUR HUNDRED AND TWENTY DOLLARS AND THIRTY-SEVEN CENTS..\$1,051,429.37

III.—The Company has NO DEBTS

IV.—The amount of Insurance effected during the year, and which remained in force December 31, 1865:

Fire.....\$12,973,949

Marine.....481,403

This Company commenced underwriting Marine Risks, August 1, 1865.

V.—This Company insures against the following risks, viz: BUILDINGS, HOUSEHOLD FURNITURE, MERCHANDISE, RENTS, LEASEHOLD, VESSELS IN PORT AND THEIR CARGOES, and other PERSONAL PROPERTY, AGAINST LOSS OR DAMAGE BY FIRE.

Also, on CARGOES, TREASURES, COMMISSIONS, PROFITS, and WAR RISKS, and ON ALL MARINE AND INLAND NAVIGATION RISKS, TO AND FROM ALL PORTS IN THE WORLD.

VI.—This Company will take on any FIRST-CLASS RISK not to exceed \$75,000 (the limit fixed by law), and on all large risks will reinsure to an extent consistent with PRUDENCE in other RESPONSIBLE COMPANIES.

J. HUNT, President.

Will examine, survey and report upon mines, and consult and advise concerning investments in mining property, or the machinery management and expenditures of mines. 224

New Mining Advertisements.

Cordillera Gold and Silver Mining Company,

Chihuahua, Morelos Mining District, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighteenth day of July, 1866, an assessment (No. 7) of one dollar per share was levied upon the capital stock of said company, payable immediately in United States gold coin, to the Secretary, No. 321 Washington street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the twenty-fourth day of August, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the thirtieth day of September, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

H. R. REEO, Secretary.

Office, 321 Washington street, San Francisco, Cal., near Front.

N. B.—Until further notice, all advertisements of this Company will appear in the MINING AND SCIENTIFIC PRESS.

San Francisco, Cal., July 19th, 1866. j21

Diana Gold and Silver Mining Company,

Lander County, Nevada.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the seventh day of June, 1866, the several amounts set opposite the names of the respective shareholders, as follows:

Names. No. Certificate. No. Shares. Amount.

Allen, H. H. 234 3 \$15 00

Alman, Jno 304 7 35 00

Alman, Jno 375 6 30 00

Bateman, I. C. 211 4 20 00

Biddle, M. E. G. 333 17 87 75

Cutter, H. F. 14 21 105 00

Cutter, H. F. 248 10 50 00

Cutter, H. F. 336 10 50 00

Carr, J. S. 236 10 50 00

Dawley, J. S. M. & Co. 161 5 25 00

Dawley, J. S. M. & Co. 162 5 25 00

Oawley, J. S. M. & Co. 161 10 50 00

Light, C. H. 2 6 31 25

C. WINTER, Secretary.
Office, No. 808 Montgomery Street, San Francisco, Cal.

Our Patent Agency.

The Patent Agency of the Mining and Scientific Press has been organized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of Letters Patent from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency on this coast.

MUSIC PRINTING, AT THE MINING & SCIENTIFIC PRESS Book and Job Printing Office.

We have a large font of Music Type (the only one on the Pacific Coast), and are prepared to print Sheet Music or Music Books on favorable terms. DEWEY & CO., Corner Clay and Sansome Streets.

Mining Notices—Continued.**Antioch Premium Petroleum Company, Location of Works: Antioch, Contra Costa County, Cal.**

And in accordance with law, and an order of the Board of Trustees, made on the 20th day of May, 1886, so many shares of each parcel of said stock as may be necessary, will be sold at the auction rooms of Maurice Dore & Co., 327 Montgomery Street, San Francisco, on the 17th day of July, 1886, at the hour of 12 o'clock M. of said day to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

CHARLES BAUM, Secretary.
Office, 510 Battery Street, San Francisco, Cal.

POSTPONEMENT.—The above sale is hereby postponed until Saturday, the twenty-eighth (28th) day of July, 1886, at the same hour and place. By order of the Board of Trustees.

CHARLES BAUM, Secretary.

Eagle Quartz Mining Company, Location of Works: Amador County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eleventh (11th) day of July, 1886, an assessment of one (1) dollar per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at the office of the Company, No. 10 Exchange Building (713 Montgomery Street), San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the eighteenth (18th) day of August, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the fifth day of September, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN M. BURNETT, Secretary.
Office, No. 10 Exchange Building, San Francisco, Cal.

Gold Hill Tunneling Gold and Silver Mining Company, Location: Gold Hill Mining District, County of Storey, State of Nevada.

Notice.—The Third Annual Meeting of the stockholders of the above named Company, will be held at their office, 415 Montgomery Street, San Francisco, Cal., on SATURDAY, the twenty-first (21st) day of July, 1886, at 7 o'clock P. M., for the purpose of electing Trustees to serve for the ensuing year, and such other business as may properly come before it.

R. WEGENER, Secretary.

N. B.—All stockholders who cannot be present are requested to file their proxies with the Secretary.

POSTPONEMENT.—The above meeting is hereby postponed until Tuesday, the 31st day of July, 1886, at 3 o'clock P. M.

R. WEGENER, Secretary.

George Washington Gold and Silver Mining Company, Silver Mountain District, Alpine County, Cal.—Assessment No. 12.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 26th day of June, 1886, an assessment of one dollar and a half (\$1.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, only.

Any stock upon which said assessment shall remain unpaid on the 25th day of July, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 13th day of August, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Office, 338 Montgomery Street, San Francisco, Cal.

Notice.—At the above meeting of the Board of Trustees, an order was passed, that the undersigned, General Agent and Attorney in Fact of the Company, with full power to take such steps as he may deem proper, to work the ores of the Company, and further develop the mine; and to that end may employ competent persons, lease or build mills, erect furnaces, enter lode, make and let contracts, sign seal and deliver obligations, and do and perform whatsoever thing else may be deemed for the interest of the Company, and with power to employ and substitute a Secretary during his absence.

W. D. ROOT, Secretary.

Great Central Mining Company, Location of Works: Yuma County, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the second (2d) day of July, A. D. 1886, an assessment of one (1) dollar per share was levied upon the capital stock of said Company, payable immediately, in gold coin of the United States of America, to the Secretary, at the office of the Company, No. 302 Montgomery Street, between the hours of 4 and 6 P. M.

Any stock upon which said assessment shall remain unpaid on the third (3d) day of August, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on the twenty-seventh (27th) day of August, A

THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; a, Dies; c, Shoes, and c, Openings.

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan when properly constructed, are respectively 177, 118 and 132.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan one hundred and eighteen tons, and the Conical Pan one hundred and thirty-two tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes direct from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been furnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works.

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the
PACIFIC FOUNDRY,
1st
San Francisco.

IRON!

Glasgow Iron and Metal

IMPORTING COMPANY,

Nos. 25 and 27 Fremont street, San Francisco.

Keep constantly on hand a large assortment of

Bar Iron,

Boiler Tubes,

Anvils,

Cast Steel, Etc.,

Which they offer to the trade on liberal terms. 18v12-3m

LEFFEL'S

American Double Turbine

THIS WHEEL, WHICH HAS HAD THE most successful record of any wheel ever made, and which has given unusual satisfaction whenever used, is now for sale by KNAPP & GRANT, 310 Washington street, San Francisco, where persons desiring to use water-power can be supplied. These Wheels are adapted to use from 10 to 5,000 inches of water, and from 4 feet to 20 feet fall. Let us know how much water you have either in miner's inches or cubic feet per minute, what fall you have, and what power you require. Write or send for circular or to
KNAPP & GRANT,
—ALSO—
San Francisco.

Leffel's Lever Jacks,

For railroads, cars, or wagons; Railroad Jacks for engines and cars; Track Jacks for leveling, with which three men, with a pair of these Jacks, can level more track in a day than twelve men working in the ordinary manner; also, Track Jacks for relieving the axle of pressure to replace the brass. These Jacks are now in general use in the Eastern States, and give entire satisfaction. Also, Wagon and Track Jacks of the most superior make and kind. For sale by
KNAPP & GRANT,
San Francisco.
18v12-3m

BAUX & GUIDO'S Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgamators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIDO'S Pan, are the following: The trifling cost for attendance; its small cost; its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping; as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jefferson Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Grall's Gravel Cement Works, Nevada county; Walman's Chlorination Works, Nevada Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works and San Francisco Foundry, San Francisco, and at Hough & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address
J. B. BAUX,
Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco.

18v12-1f SACRAMENTO, CALIFORNIA.

To Ditchmen, Millmen and Others Requiring IRON PIPE.

M. R. ROSE, CORNER OF 9TH AND K STREETS, 1st. Sacramento City, has facilities unsurpassed in this State for the manufacture of IRON PIPE of every description. He also has on hand a deep well FORGE PUMP of his own invention and manufacture, well adapted for oil wells. His tools being portable, pipe can be manufactured on the ground.
18v12-2

EXCELSIOR PUMP!

HOOKE'S PATENT!

THIS DOUBLE-ACTING SUCTION AND FORCE PUMP CHALLENGES COMPETITION for simplicity, durability and power, and will work at any depth. The pistons for Mining Pumps are packed with hemp. The valves are reached by simply removing the "bonnets," thereby avoiding the trouble of raising a long column of pipe. They will raise as much water as TWICE their size of single-acting Mining Pumps, and are sold at half the price. We have never heard of the valves in this Pump being out of order. For their many superior points they are fast replacing all other Force Pumps. Reference can be given where this Pump is working with eighteen others of different patterns, and is pronounced THE BEST; also, from some of the best miners in the State who have them in use. For manufacturers, farms or domestic use, we warrant them the best and cheapest. All sizes adapted to any power or any purpose. For sale by agents throughout the State.

J. W. BRITTON & CO.,

General Agents,
120 Front street, San Francisco.

S. B. STODDARD,
Corner of Battery and Pacific streets.
18v12-3m

June 23, 1866.

Union Amalgamator.

This Valuable Invention

ITS FAST FINDING ITS WAY INTO GENERAL USE, NOT by means of combination of capital and influence, but on the strength of its own merits, and upon the principle that what is known to be good will be appreciated. Practical men acknowledge the UNION PAN to be scientific, the best, the cheapest, and most profitable. It now stands first on the list of all pans in use for the purpose of

Working Gold and Silver Ores.

It has been found that a low class of ores, also tailings from Mills, sulphurets, etc., that will not pay to work with the common pans, may be worked with this and obtain large profits. The UNION PAN is manufactured in two sizes, and capable of operating upon large quantities of ore in the most efficient manner.

Parties interested in Quartz Mining, Mills, etc., will find it to their advantage to call and examine for themselves, and see its operation.

Gold and silver ores tested by regular mill process, at moderate cost, by

STRONG & CO.,

San Francisco Foundry, corner Mission and Fremont streets, where orders will receive prompt attention.

BRUCKNER'S

Mechanical Roasting Furnace

AWARDED A

PREMIUM SILVER MEDAL

—BY THE—

The Mechanics' Institute.

THESE FURNACES ARE NOW MANUFACTURED AFTER an improved mode of construction, which GREATLY SIMPLIFIES THEIR OPERATION,

and afford a much larger oxidizing surface to the action of heat and atmosphere.

The weight of a Furnace nine feet long by four feet in diameter does not exceed one ton.

THE IMPROVED FURNACE

May be seen in operation, for desulphurizing or roasting and chloridizing, at Central Mill, Virginia City, Nevada.

Parties wishing to erect such Furnaces, are requested to leave their orders with

T. KALLENBORG,

19v12 416 Market street, San Francisco.

FLORENCE SEWING MACHINES!

COPY OF THE REPORT OF THE COMMITTEE OF AWARDS AT THE FAIR OF THE

AMERICAN INSTITUTE,

New York, 1865,

—TO THE—

Florence Sewing Machine Company,

FOR THE BEST FAMILY SEWING MACHINE.

HIGHEST PREMIUM—GOLD MEDAL!

REASONS:

- 1st.—Its simplicity and great range of work.
- 2d.—The Reversible Feed Motion.
- 3d.—The perfect finish and substantial manner in which the machine is made.
- 4th.—The rapidity of its working and the quality of the work done.
- 5th.—The Self-adjusting Tension.

The "FLORENCE" was awarded the First and Highest Premium at the State Fair of California, the only Fair on the Pacific Coast at which any two double-thread Sewing Machines were exhibited in competition in 1865.

The "FLORENCE" received the only premium awarded by the Mechanics' Institute of San Francisco in 1864 and 1865, to any Sewing Machine, Sewing Machine Company, or Agent. The claim of a competitor to a medal is without any foundation whatever.

Wherever the "FLORENCE" has been brought in competition with other Sewing Machines, it has always been declared the best. It is the most simple, the most substantial, the most efficient, and its use is easily learned. Every Machine sold is guaranteed in the full sense of the word.

Send for Circulars and Samples of Work.

Pacific Forge Company.

FORGING AND IRON WORK.

THE PACIFIC FORGE COMPANY HAVE JUST ERECTED, in this city, on Fourteenth street, near the machine shop of the San Jose Railroad, a large establishment for the purpose of forging and working in wrought iron. Our hammer is the largest upon this coast, and we are prepared to manufacture, at short notice, all kinds of heavy forgings, our axes, shafts, straight cranks, pistons, rods, wagon axles, and other similar work. This is the first general shop of the kind erected in this State, and we solicit the patronage of the public. All orders executed at reasonable rates, and with promptness and satisfaction.
18v12-3m

SALMON.—Where does the salmon go when he is in the sea? You may catch him in salt water as he is going up the rivers. Where does he spend the rest of his time during the six months or so he passes in the ocean? Was one ever caught out in the far ocean? What does he take a fly for? A trout fly is an imitation, but a salmon fly is like nothing in heaven or earth. Moreover, as far as I know, salmon do not eat real flies. In fact, it is hard to say what salmon do eat in fresh water. When you catch them their stomachs are always empty. Surely a large Namisen fly, all silver twist and golden pheasant feathers, is nothing like a salmon can have ever seen. Besides a salmon will take a boiled prawn; surely he can never have seen that before. And thirdly, I want to know why the more a river is fished the slier the fish are. You will find this the case not only towards the end of the season, but also will experience the same the next year when you first begin. Do the few fish who are hooked and get off, tell their neighbors and friends that a salmon fly is not the most desirable thing to put into their mouths?

IMPORTANT HINTS TO PARENTS.—Few parents realize how much their children may be taught at home, by devoting a few minutes to their instruction every day. Let a parent make the experiment with his son of ten years old for a single week, and only during the hours which are not spent in school. Let him make a companion of his child, converse with him familiarly, put to him questions, answer inquiries, communicate facts, the result of his reading and observation, awaken his curiosity, explain difficulties, the meaning of things, and all this in an easy, playful manner, without seeming to impose a task; and he himself will be astonished at the progress which will be made.

SIR JOHN MASON, Privy Counsellor to Henry VIII., spoke as follows upon his death-bed: "I have seen five princes, and have been privy counsellor to four. I have seen the most remarkable things abroad, and been present at most state transactions for thirty years. After all this experience I have learned this, that seriousness is most commendable; temperance the best physic; and a good conscience the best estate."

DANGEROUS TO WEAR.—Paper enamelled collars are bad to wear if the enamel comes in contact with the neck. Several clerks in Boston have been poisoned by the lead absorbed into their systems from such collars.

J. B. COSE, BUSINESS AGENCY.—Makes private sales of Property and Business Places of every description, in the city and throughout the State; procures partners with large and small amounts of money; negotiates sales of mining property, and does a General Agency Business. Patronage solicited by mail, express, or by personal application at the office, 402 Montgomery Street, San Francisco, California. 2v1114

HORTON'S PATENT CALENDAR CLOCK!

MANUFACTURED BY THE
ITHACA CALENDAR CLOCK COMPANY,
Ithaca, N. Y., and for sale by
W. J. EGBERT, Agent,
At Job M. SEAMAN & Co's, 631 WASHINGTON STREET,
San Francisco.

THIS TIME PIECE costs but a trifle more than any other good clock, and is just the article for every well-regulated business house, office, saloon, or, in fact, any place where a handsome, perfect time-keeper is duly appreciated. The Clock has two dials, the first being the same as an ordinary clock; the second has but one pointer, and shows the day of the week, the month and day of the month. It is arranged to mark the days in leap years with equal regularity. It is an eight-day piece, and runs from year to year without change. It can be examined at the Office of the Mining and Scientific Press. 25v13p14f

THIS CUT REPRESENTS AN AMALgamator and Separator that has stood the test of thirty years' practical working in the gold mines of California, and for nearly the same time in the silver mines of Nevada, having been introduced into the first steam mills built in the latter Territory, since which time they have been successfully working against all competition.

The great advantages these Amalgamators have over any others, are—

1st. Much less Cost.

2d. They do not "flour" the mercury, and collect any that may have been "licked" in the battery or grinders.

3d. The "shaking" motion given to the pulp (by the revolution of the miller under the stationary frame) against the amalgamated copper plates that are fastened to the frame, and by this means catching the fine gold and mercury that will not settle.

4th. The gate in the cone, through which the pulp is discharged, from the top, and where there is the least motion, almost precluding the possibility of any granulated mercury or fine gold escaping.

There are over 500 of them in use in California and Nevada, where those interested can see their practical workings.

Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make,

HOADLEY'S.

FOUR SIZES,

8, 10, 12, and 15-Horse Power,

HOADLEY'S.

3 to 40-Horse Power.

HITTINGER'S.

THREE SIZES,

5, 7, and 10-Horse Power

HITTINGER'S.

TWO SIZES,

5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, and Economy, with the Minimum of weight and price.

These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes. Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 20 horse power, with and without carriages.

Also, Portable Saw and Grist Mills.

STANDARD SOAP COMPANY'S WASHING POWDER,

THIS POWDER IS SUPERIOR TO ALL OTHER PREPARations for washing and cleansing. It is made of pure material, and contains nothing that will injure the finest fabric. Equally as good for using in hard as soft water. One pound will make three gallons of beautiful soft soap. Put up in wrappers of 1-lb each, and in wooden boxes of 10-lbs bulk. Ask your grocer for a package, and test its virtue. Manufactured at 207 Commercial street, San Francisco. 15v12q

Mechanical Drawings.

Persons wishing Mechanical Drawings can obtain the services of competent draughtsmen, by applying to this office. 16v23

A MODEL QUARTZ MILL.—Messrs. Hanscom & Co., of the Aetna Iron Works, have just completed a working model quartz mill, which forms a novel and attractive machine, in operation. The battery consists of a cast iron mortar, hotted firmly to a black walnut bed and frame, with screen, four stamps, shaft, cams, fly-wheel, etc., complete. Each stamp, with shoe, stem and tappet, weighs about four pounds. A 12-inch Eureka grinding and amalgamating pan is connected to the cam shaft of the battery, so that the whole is operated together. This mill is prepared to take in small rock, and crush it fine enough to pass through the screen into the pan, where it is finally reduced and amalgamated as perfectly as it could be done in a full-sized quartz mill. The mill was ordered through the MINING AND SCIENTIFIC PRESS AGENCY, for M. J. Henley, Esq., of Dayton, Nev., who is now on a visit East, and intends to exhibit this model at the Universal Exhibition, at Paris.

NEVADA STATE MINING LAW REPUDIATED IN UNION DISTRICT.—The miners of Union District, Ions City, State of Nevada, do not appear to be very well satisfied with the recent action of the Nevada Legislature concerning the location and possession of mining claims. At a recent meeting of the miners of that district, the following resolutions were unanimously adopted:

WHEREAS, The Legislature of the State of Nevada, at its last session passed a law concerning the location and possession of mining claims, the provisions of which, in our opinion, are not only unjust and oppressive to the miners, but in direct conflict with the Constitution of said State, therefore,

Resolved, That we, the miners of the Union Mining District, Nye county, Nevada, are in favor of and do hereby declare, that we will continue to locate and hold possession of mining claims in this district, in accordance with the provisions of our present existing District Mining Laws, the provisions of the said legislative enactment to the contrary notwithstanding.

Resolved, That we now proceed to elect a Mining Recorder for Union Mining District, under and in accordance with our present District Laws.

The following fees have to be paid according to the law to which the resolutions refer, upon a claim of 2,000 feet: To the Mining Recorder—filing notice of claim, 25 cents; measuring 2,000 feet (20 cents each 100 feet), \$4; measuring assessment work, giving a certificate, recording and indexing the same, \$2; recording and indexing notice of claim containing less than 200 words, \$1, making \$7.25. To the County Recorder—Filing notice of claim, 25 cents; indexing the same, ten names, \$5; recording same 200 words, 60 cents; stamps on certificate, 10 cents, making \$5.95. Total, \$13.20, payable in currency.

SULPHURETS.—Any person who may have, in this city, a lot of sulphurets or sulphureted ore, which they desire to have desulphurized, can have that service performed free of expense by giving notice of their desire at this office any time during the coming week.

THE CHALK BLUFF BLUE GRAVEL MINING COMPANY, which has recently made a very extensive location above You Bet, in Nevada county, is now fully organized for work. The superintendent, Mr. Stronnanhan, accompanied with a competent engineer, went up on Thursday last to lay out and commence the work of opening up the mine.

TO IDAHO VIA CHICO.—The stage and foot freight line to Boise City and Idaho is now in successful operation.

Change in Prices.

Single Copies of the MINING AND SCIENTIFIC PRESS will hereafter be sold at FIFTEEN (15) CENTS. By City Carriers, 50 Cents per month; Monthly Series, 65 Cents. The rates of Yearly Subscriptions, at the office of publication, remain as heretofore—\$5 per annum. The price to News Agents will be advanced 1 1/2 cents per copy. Agents in the Interior supplied. June 30, 1866.

June 23d, 1866.

J. HENDY, Patentee.

Figure 1.

Figure 2.

Hendy's Improved Patent Self-Discharging Sulphurets

PRATER CONCENTRATOR

Is Receiving Universal Favor.

Reference is made to the following Mills which have them now in use:

BENTON MILL, Bear Valley, Mariposa County. SPRING HILL MILL, Amador, Amador County.
LOUSTAN MILL, near Conterville, Mariposa County. GOLDEN GATE MILL, Volcano, Amador County.
OPHIR MILL, near Newcastle, Placer County. RAWBLIDE MILL, Jamestown, Tuolumne County.
C. H. SCHNABLER'S MILL, Doty Flat, Placer County. TRIUNFO G. & S. M. CO., Lower California, Mexico.
CONY MILL, Jackson, Amador County.

And in use in many other parts of this State; also in Idaho, Arizona, Colorado and Mexico.

As a further evidence of its worth, orders have been received recently from the proprietors of the following mills, all of whom are using these Concentrators, or have works in the immediate neighborhood of mills using them, viz.:

One Concentrator for the Ophir O. & S. M. Co., near Newcastle, Placer County, ordered by Welty & Foster, who are using two Concentrators; one Concentrator for the Benton Mill, Mariposa County, ordered by Messrs. Dodge & Bro., of this city, who are using seven of them in the same mill; one Concentrator, ordered by Messrs. Bigelow & Bro., of this city, for the Cony Mill, Jackson, Amador County, where they have already three of them in operation.

They may be seen in operation at the GOLDEN STATE FOUNDRY, No. 19 First Street, San Francisco.

DESCRIPTION:

FIGURE 2 is a sectional view. C, is the Hopper in which the tailings are thrown. The tailings then distribute on the Distributor, B. The tailings enter the pan, A, at its periphery, and the debris discharges near its center, and passes off in the spout, F. The sulphurets discharge at gate, E, amalgam and quicksilver at plug, I. J, is a horn-shaped cavity for collecting quicksilver and amalgam. S, is the sulphurets. M, M, the agitating bars, with copper plate, coated with mercury.

The agitating bars operate on top of the pulp. They are acknowledged to be, by those using them, a valuable improvement. [An extra charge of \$15 is made when these bars are furnished.] The pan, A, shows a curve-linear bottom, which gives a more precipitous descent near its center, for the purpose of forcing the sulphurets towards the periphery. It will be noticed that the centrifugal force diminishes towards the center of the pan, for which reason the inclination is increased for the purpose above mentioned.

The pan, A, has an inclination at its periphery, towards the gate, E, for the purpose of forcing the sulphurets to the discharge gate. At the same time the center rim is level; the sulphurets, S, being forced by the oscillating motion of the machine, and are discharged through a small opening in the pan at gate, E.

JAMESTOWN, TUOLUMNE COUNTY, CAL., July 15th, 1866.

JOSHUA HENDY, Esq., San Francisco:—MY DEAR SIR: It gives me pleasure to inform you that the four "Improved Self Discharging Prater Concentrators," which I purchased from you, have now been in operation in the Rawblide Mining Company's Mill for more than two months, and have more than realized my expectations.

I am free to say it is the best Machine for saving Quicksilver, Amalgam, and Sulphurets that I have ever used or seen used for that purpose. I shall take pleasure in showing any one interested the Machine in operation, who will call at the mill. I shall need four more as soon as the balance of our mill is completed. Yours truly,

R. P. JOHNSON, Superintendent Rawblide Mill Company.

A Circular giving further particulars will be mailed to any part of the United States free of expense. Address,

JOSHUA HENDY,

402 Montgomery street, San Francisco, Room 3, Fourth Floor.

AERATED BREAD.

The making of bread by forcing carbonic acid gas into the dough, instead of generating it by fermentation in the dough itself by soda, cream of tartar, or other chemicals, was first introduced in 1854, since which time various modifications and improvements of the

sel, A, over the mixer, and the air in both vessels exhausted by the air pumps in the tank, L, which are driven by a steam engine, whose boiler is seen under the platform on which the pump-tank stands. When the air is exhausted, carbonic acid gas is let into the mixer and water vessel, and is also forced into them by pumps, until it has a pressure of two atmospheres. The water

falls when a valve is opened. As soon as the dough has fallen into the receiver, the valve is closed, and the mixer is ready for another batch, which will be mixed while the previous batch is being molded. At this stage occurs an important part of the process, called "vesiculation," by which a proper texture is given to the dough, by compression of air, within

of the process is well arranged, the bread has an even, fine spongy texture, without large air-holes, or lumps insufficiently spongy or "vesiculated."

As will be seen, the delivery door of this vesiculating chamber, is close to the oven-door, O, and the pans, in rows on boards as long as the oven mouth is wide, are drawn out of the vesicator and put into the oven. A row of pans, on the board, is shown in the mouth

machinery employed for accomplishing the end have been devised. The machinery illustrated by the accompanying cut gives a very good idea of the general principles of the operation, now in use by the Boston (Mass.) Wheat and Bread Company, as illustrated in the *New York Artisan* of May 9th, 1866.

The flour, after being sifted by machinery, is placed, with a proper quantity of salt, in the mixer, B, which, when the cover is on, is a strong air-tight vessel. Water is then put into the ves-

is then admitted from the vessel, A, to the flour in the mixing vessel, B; and a kneading fan in the mixing vessel is set to work by the machinery shown outside; and in from three to six minutes, according to the proportion of gluten in the flour, the mixing is completed. The dough is then ready to be made into loaves. In order that the apparatus above described may not be kept idle until the batch is molded into loaves, there is, under the mixer, B, a receiver, C, into which the dough

each baking pan before it receives the dough from the measuring valve. Attached to the receiver, C, is an automatic apparatus, D, which receives compressed air from the column, E, so that there is always the required pressure in the vessel, D, in which the dough is measured into the pans. Several pans being filled, the pressure in the vessel, D, is gradually lowered, so that the bread rises gently and steadily, without bursting its gas cells, and losing its carbonic acid gas. When this part

of the oven, and another row is being drawn from the vesicator. The oven has in it a revolving apparatus which carries in the pans, and delivers them when the baking is completed. The bread is then shaken from the pans into the baskets in which it is carried to the dealers or consumers, and the baker's hands never touch it or any of the materials of which it is made. In an hour thirteen hundred and forty-four loaves are made from flour in the barrel; by the old process several hours are necessary to form the sponge, and more time in kneading, raising and baking.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

(Written for the Mining and Scientific Press.)

Notes on the Chief Gold Districts Throughout the World.

BY PROFESSOR ROWLANDSON, F. G. S. L.

THE URALS.

Sir Roderick Murchison, in his magnificent work on the "Geology of the Russian Empire," appears to have pretty well established his point that the gold-bearing rocks of this range, so far as they have been explored up to this time, belong to the Silurian era. In a range, however, of 500 miles in length, it is possible points may have been overlooked where auriferous strata may, perhaps, penetrate secondary rocks. Respecting the Altai, I have never seen the work referred to by Sir Roderick, and can only apply the same remarks which I have done to the Urals.

THE BRITISH ISLES.

All the instances known to me where gold is found in any notable quantity, excepting two, pertain to the Silurian period. The exceptions are a vein of pyrites, in the carboniferous limestone of the North of England, which accompanies the galena of that district, and another more remarkable one in the same formation, situated in Staffordshire, which, singular to relate, contains about five ounces of silver and one hundred and fifty grains of gold to the ton of lead, whilst in the extensive galena district, occupying probably 500 square miles of territory, there are scarcely any which contain more than two ounces of silver to the ton of lead. The gold-bearing galena of Staffordshire differed in crystallization from that found in all the neighboring veins, some of which were not 100 feet distant.

THE IBERIAN PENINSULA.

Probably Sir Roderick Murchison is right in supposing that gold obtained in ancient and modern times in Central Spain was derived from Silurian rocks. He also has instanced paleontologic evidence in the authority of Cassiano de Prado, that the Sierra Nevada, Morena, etc., including the quicksilver mines of Almaden, belong to the same formation. I expect the latter statement is based, as probably are many similar ones, more on the fact that in the vicinity of these mines the neighboring rocks are metamorphosed into talc and igneous rocks of granite type, which have hitherto been almost universally held only to underlie the more ancient aqueous deposits, and from this circumstance have been denominated primary rocks. Now that it is known that the so-called primary rocks have, in many instances, been formed and placed in the positions where they are now found, within very recent geological periods, the contiguity of these form unsafe guides, so far as the age of metalliferous veins are concerned. If it is true that the Almaden mines of Old Spain belong to the palæozoic series, they form an exception to any other quicksilver mine, the geology of which is as well ascertained as is that of the New Almaden, New Idria, and San Luis Obispo mines, California, and the Idria and Palatinate in Germany. As black slates, impregnated with mercury, are found near Almaden, and members of the chalk series are found on the Sierra Nevada, better proof than any which has yet been brought forward ought to be adduced, before it is accepted as true, that the quicksilver, auriferous and argentiferous region of Southern Spain, belongs only to rocks of Silurian age; particularly when it is stated that auriferous ores are found in the Pyrenees, adjacent to rocks of a cretaceous era. The upheaval of the Pyrenees has been usually assigned to a period that is post-cretaceous. Like the closing of the carboniferous age, the completion of the cretaceous series appears to have been accompanied through most parts of the world, especially where metalliferous veins abound, with violent convulsions and the eruption of plutonic rocks, during which and subsequently, the major part of those mines have been made accessible to man,

which yield what are termed the noble metals.

NORICUM (THE TYROL).

I have employed the term Noricum for the northern portion of Italy, the Tyrol, and because that term was used in the number of this journal published on the 30th Dec. last, in describing a sudden decrease in the value of gold, which took place in the time of Polybius, owing to the large influx which was obtained from the *Taurisci Norici*. If there exists a fair show of reasoning in favor of the metalliferous region of the southern, and also of the Pyrenean portions of the Iberian peninsula, being composed of rocks more recent than Silurian, these reasons hold much stronger when we come to consider the geological features of the Tyrolean Alps, a large part of whose superfaces are composed of rocks ranging from the Triassic to Tertiary age, mixed with veins of auriferous pyrites,* and accompanied by petroleum springs and lignite beds; the latter becoming so fully developed in some parts of Hungary as to be of considerable economic importance; all which circumstances, form a strong analogy to what is exhibited on the Northwest Pacific Coast of America.

Passing by Hungary, with only the brief notice that the auriferous mines found in that kingdom may possibly have the same relation to the post-cretaceous upheaval of the Carpathian mountains, which have already been referred to in the instance of the Pyrenees, I will at once proceed to relate some additional circumstances tending to show a considerable, if not a complete, identity in the geological surroundings and mineralogical composition of the gold ores of Transylvania, and the neighboring parts of Hungary, with those found in California and the contiguous States and Territories. The physical features of the European district, I am informed by natives thereof, greatly resemble those found on both flanks of the American Sierra Nevada, accompanied, as in California, occasionally with wide, flatish plains, the surface of which is formed principally of broken quartz. In California and Transylvania, the auriferous ore is frequently, in fact, almost always, to a greater or less degree, bisulphides, tellurides and selenides of iron,* with gold; tellurium forms occasionally a definite compound—the telluride of gold, as at the Melones mine near Carson Hill, and at other places. It is probable that selenium, either alone or combined with sulphur, tellurium or both, occasionally forms natural compounds with gold. In the upper parts of mines where minerals, such as those described, have been exposed to aqueous and atmospheric agencies, these compounds frequently become decomposed, thus setting the gold free; oxides of iron only remaining loosely associated therewith to indicate its former condition. Such free gold easily amalgamates, and in that state is almost always wholly extracted from the matrix when mercury is employed with that object. As the miner descends in depth, the free gold thus formed becomes less and less, as he penetrates further below the influences named; it may thus happen that much that has been stated of the decline in value of gold veins as they descend, may have arisen, not so much on account of any given measure of the matrix, say a cubic foot or a cubic yard, or a given weight, as for example, a ton yielding a less per centage of gold, but rather from the fact that in practical working a lesser weight of the precious metal is benefited, a large portion, if not the whole of which lessened product cannot but in many cases be attributed, not to the fact of the non-existence of gold, but from its being so combined with other substances that its thorough extraction is a matter of extreme, and occasionally of insuperable difficulty, by the agencies ordinarily employed.

Notwithstanding the attempted explanation above given, of the apparent decrease in the yield of gold veins as they descend, I am free to confess that I am strongly impressed with the opinion that the large nuggets, pepitas, etc., etc., which occasionally have been found, occur much more frequently in the superior than the inferior portion of auriferous veins; in the latter instance the gold is commonly found not only more finely diffused through a greater amount of quartz, but also more intimately mixed with the metallic and other mineral compounds, already noticed. In this way it is easy to conceive why a gold mine, having a width of only three feet at or near the surface, in which the gold presents itself in a metallic form, may be exceedingly profitable to

*In this district, nearly two hundred years ago, was employed, for the first time, the mode of amalgamation which is the basis of all the modern pans.

*It is the presence of these substances which give rise to the so-called refractory ores; owing to the almost insuperable difficulty in securing a perfect amalgamation, excepting by the aid of some preliminary process.

work, and be productive of immense wealth to the lucky owners; but when the same descends some 600 or 700 feet, and only a like, or even somewhat greater amount, is found disseminated through the vein when it has dilated to forty, sixty, or, as is sometimes seen in California, to one hundred and twenty feet in width, may not only become profitless, but occasion loss; especially when, as generally does happen, the gold in the latter case is intimately allied with the minerals alluded to, owing to which circumstance the true refractory has been applied to them; so that a mine, viewed as a whole, may actually increase in absolute richness, when viewed as a totality, as it descends yet becomes worthless as a commercial enterprise. According to the observations made by myself, and information derived from others, I am inclined to believe that in Transylvania tellurium forms the chief disturbing ingredient, whilst in California ores, selenium is more frequently the obnoxious alloy, and in both countries the sulphides of iron alone, or combined with the two first named substances, largely participate in increasing the difficulties of securing the complete reduction of the gold from its matrix. Though it be conceded that in many or all cases, auriferous veins become unproductive of commercial profit in proportion as they proceed in depth, it would be very unphilosophical to base, on such assumed fact, any theory respecting the primary influences which have led to the formation of auriferous veins.

[To be Continued.]

THE STEREOSCOPE—ITS PHILOSOPHY.

This beautiful instrument, which has recently become so popular, was originally devised for the purpose of demonstrating the theory of binocular vision; or in other words of exhibiting the effects and advantages of having two eyes. The principle of the Stereoscope has been known for centuries, although it is only within a few years that the instrument itself has come into use. It now finds its way into almost every social circle, and is made a most important medium of amusement and instruction. By it we can look in upon the ruins of Herculaneum and Pompeii, or into the dark recesses of the Egyptian Pyramids, or upon the wonders and beauties of nature, or the works of art, or scenes of domestic life, with almost as much pleasure as though we were bodily present to view them.

Our readers are all aware that this instrument is so constructed that two perfectly flat photographic pictures, taken under certain conditions, appear to present solid or projecting bodies, possessing all the roundness and reality of nature. Our young readers especially, and all who have not studied into the philosophy of this curious instrument, will, we are assured, be much pleased to read an explanation of how this remarkable result is obtained; or how, by the aid of this simple instrument, these double pictures are made to appear but one, and that one so accurately represent nature itself. We will endeavor to explain the philosophy involved in this simple instrument.

All bodies are rendered visible by the light which radiates from every point of their surface. These rays, by the peculiar formation of the eye and the laws of optics, are brought to a focus and made to form a picture of the object upon the retina of the eye. As soon as this picture is formed upon the retina, the impression thus produced is carried to the brain by the optic nerve, so that it is not really the eye which sees but the mind; while the judgement, educated by experience, determines the positions, relations and distances of the objects thus painted upon the retina of the eye.

Now when we look at objects, two pictures of whatever we see are thus painted—one upon the retina of each eye, just as two pictures must be formed to produce the phenomena of the Stereoscope.

To illustrate this fact, hold up a small book, a little over an inch in thickness, just in front of the nose on your face, with its back towards your eyes and at just the distance at which you can see both covers. Now close one eye and you will see but one cover; close the other eye, and open the first, and you will see the other cover. You must know from this experiment that the two images formed on the retina of the two eyes must differ slightly

the one including more of the right side of the book, and the other more of the left side. Thus two images of the same object, with differences of outline, and consequently of light and shade, will be formed—one upon the retina of each eye. These two images convey to the mind but a single object, the effect of which is to cause it to stand out. It is thus when we look into a grove of trees, we are able to determine that one portion of the trees stand farther from us than another.

A person looking with one eye only cannot readily distinguish either the form of a body, or its exact position so as, if it is near by, to reach out and touch it by the hand. As a proof, close one eye, approach a burning candle, and attempt to snuff it or take a hold of it. You would experience more difficulty in doing so than you would suppose would be met with before trying the experiment. Before you are aware of what you are about you will be moving your head from right to left in order to place your single eye in the relative positions which the two should occupy, in order to correctly determine the exact locality of the candle.

The object of the stereoscope is to deceive the judgment, and make absolutely flat surfaces appear to be rotund or projecting figures. This is accomplished by making two pictures to correspond to the two images that would be painted upon the two eyes were they before the objects instead of the two cameras. Although these two pictures appear to be perfectly alike, they are not so; the difference being exactly that which would appear had the right-hand picture been painted upon the retina of the right eye, and the left-hand picture on the retina of the left eye.

These pictures, so taken, are now placed in a stereoscope, which is furnished with two eye-pieces, containing lenses, so constructed that the rays proceeding from the respective pictures to the corresponding eye-pieces, shall be bent outward, at just such an angle as each set of rays would have formed had they proceeded to the eyes from a single picture, placed in the centre of the box, without the intervention of lenses.

We trust our young readers will carefully peruse what we have written, experiment with the eyes as we have suggested, and then more carefully view the pictures in the stereoscope; and if they are at all inclined to look into the philosophy of things, we are persuaded they will enjoy the pleasure and instructions of this beautiful little instrument more than over before.

A MAMMOTH ARTESIAN WELL AT PARIS.—A monster artesian well is now being put down in the city of Paris. This well is a trifle over six feet in diameter in the clear, and is now down about 150 feet. The first seventy-two feet of the shaft are lined with masonry; then succeeds iron tubing, in sections six feet and seven inches, and three feet three inches in diameter, and three feet three inches in height, forced down by same pressure. When this lining had been forced down to a depth of about 160 feet in all, a strata of quicksand was reached, which was so fully saturated with water as to admit of the passage of an underground current through the mass. This current, though slow in its motion, yet flowing under great pressure, was sufficient to drive the tube out of its perpendicular, so much so that it was found necessary to draw it. Resort was finally had to masonry laid up as follows: A strong cradle was suspended from the top of the shaft, a depth of a few feet excavated in the bottom, the cradle sunk into it, and masonry built up upon it as quick as possible. Thus completed, another section was gained in like manner. The work was prosecuted in that manner until firmer ground was reached. The work of sinking is now done by boring machinery, which weighs five tons and is composed of six branches. The wall will be carried down, if possible, with its present diameter, to a depth sufficient to allow the water to reach the surface. If the work should be successful, it will furnish a vast amount of water.

A CHURCH is a place where some people take lodging an hour or two once or twice a week.

Mechanical.

THE SCREW APPLIED TO THE PADDLE WHEEL. Several parties have been experimenting with in a few years past, here in California, in New York and in Europe, to devise some method for the application of the principle of the screw to the floats of paddle wheels for propelling steamboats. This application was conceived and tried by Dr. Croft of London, Eng., some two or more years ago, who obtained the most satisfactory results in his experiments with working models. The two kinds of floats have also been compared and tested with larger boats, with equal success. A boat, English built, with paddles similarly constructed, has been running on the Pacific side of the coast of Panama, for a year or two. In all experiments tried, we believe the screw model has been proven practically superior to the flat floats. Early in the year 1865, Prof. W. G. Adams, an English mathematician, furnished an elaborate paper to the *Philosophical Magazine* of London, in which he proved, by mathematical demonstration, that the superiority of the screw shape over the flat float was as correct in theory as in practice.

A NAVAL POWER.—A novel kind of power is employed for unloading ships at the Newport docks in Monmouthshire, England, and at some other places for other hoisting purposes. A water engine is used, and in the absence of the requisite "fall," the pressure otherwise obtained from natural sources is got at by a pressure of from 70 to 100 tons of gravel, as a weight, upon a short column of water, thereby giving a pressure equivalent to some 1,500 feet head. The power is kept up by using a small steam engine to pump the water into the reservoir, and the weight of sand, after being depressed by use, is again elevated by hydraulic power at a very small cost. The power may be distributed much more readily than steam power, to different localities in the vicinity of the main reservoir.

By the use of this machinery, the *Railway News* says that coal, which formerly cost 5d. to 7d. per ton for delivery, can now be delivered for 1½d.

NEW APPLICATION OF WATER PRESSURE.—At a meeting of the Paris Academy of Sciences, a communication from M. L. D. Girard has been read, on the application of water-pressure to the bearings of the fly-wheel of a rolling machine, weighing 35,000 kilogrammes (about 34½ tons). The principle consists in admitting water having a pressure corresponding to the weight of the axle and wheel, etc., under those parts of the axle which are supported by the bearings. It was found that, when the bearing surfaces of the axle were merely greased, the co-efficient of friction was 10 per cent; but that, when water was admitted under the axle, and the rising of the latter permitted the escape of the fluid across the whole of the bearing surfaces, the co-efficient became 0.001, and in ordinary circumstances did not rise above 0.003. The water had a pressure of ten atmospheres, derived from air condensed in the reservoir containing it. At starting the axle bearings are merely greased, and only a certain velocity can then be attained; but, the instant the water is turned on, the velocity becomes greatly accelerated. This contrivance appears specially adapted to the support of great weights moving with high velocities. The French Minister of Marine has caused it to be applied to the bearings of the screw-propeller of a steam-tug. —*Scientific Review, Eng.*

GLASS BLOWING.—Glass-blowing, in its simpler adaptations, is very easy of acquirement, and capable of affording much recreation at a small expense. Even cold glass may be worked with a facility known to few. It may be drilled in holes very easily, the only implement needed being a common watchmaker's drill stock. A steel drill, of good quality, well hardened, will do the business perfectly; and, even if the edge of the tool should give way before the hole is pierced through, a little emery-powder and oil will remove every difficulty; or, with the help of these, the hole may be bored with a copper drill. Not only so—glass may even be turned in a lathe. Any amateur turner who has operated on either of the metals may chuck a piece of glass in his lathe, and turn it with the same tools and in the same way as he would a piece of steel, only taking care to keep the chips from his eyes.

CAST IRON AND STEEL.—A NEW THEORY OF ALLOYS.—Recent experiments in Europe, seem to establish the fact that alloys do not consist of a mere mechanical combination of the particles of one metal with another; but that the union is a chemical one—that one metal is dissolved in the other, as sugar is dissolved in water. M. Jullien has recently communicated to the Paris Academy of Sciences, the result of some experiments which he combines under the head of "New Facts on Cast Iron and Steel." His object has been to demonstrate:

1st, that metals do not combine with each other; 2nd, that iron does not combine with either carbon, silicon, or nitrogen; and 3d, that a mixture of hydrate of lime and dry hydrated sulphate of soda presents all the characters of a solution, but none of those of combination. M. Jullien then gives his ideas on the constitutions of irons and steels. Liquid cast iron, he says, is a solution of liquid carbon in liquid iron. Soft steel is a solution of amorphous carbon in either amorphous or crystallized iron. Grey pig obtained by casting in hot moulds or sand, is a mixture of graphite and steel, the components, iron and carbon, being both in the amorphous state.

A MAMMOTH TUNNEL ENTERPRISE IN EUROPE.—While we on the Pacific slope are talking about a "mammoth enterprise," to tap the great Constock vein with a tunnel, which, when completed, will be less than four miles long, the miners at Freiberg, in Saxony, are making arrangements to drain their principal mining district by a tunnel, which will be some fifteen miles in length. The work has already been several years in progress. It is expected that forty years longer will be required to complete the undertaking.

DEEP WELLS.—Few persons are aware of the enterprise and energy displayed in efforts to procure water for the traveling public on the deserts and other places east of the Sierra, where natural springs or streams of water are wanting. There are some three or four wells some fifteen or twenty miles from Aurora, on the road to the Adobe Meadows, between three and four hundred feet deep. In one of these wells, 335 feet deep, the water is hot. It is drawn up, and cooled over night. The water is of a very fair quality, and is sold at the rate of twenty-five cents per bucket.

A TRIAL OF AN ENGLISH TURRET PROPOSED. The British Admiralty have determined to give the monitor system a severe trial by firing a steel bolt at one of the turrets at short range from an Armstrong 10-inch or 300-pounder gun. It is to be remembered that the English turrets are not precisely like ours. They are made of wood, with an iron plating, while ours are all iron. The English construction is adhered to in order to have a difference, in spite of the fact that this difference brings with it some decided inferiority.

RAILWAY BUILDING IN EUROPE.—French railways are so mapped out for the future, that during the next seven years, the work of road-making will proceed at the rate of 500 miles per annum. The French demand for railway material can, therefore, be calculated with great nicety. The miles of railway built in Great Britain and Ireland last year, was about 500 miles, the same figure as the contemplated annual increase of railway mileage in France.

A UNILER heated by petroleum, lately set up at Woolwich Dockyard, England, vaporized 3,000 pounds of water in three hours, at the rate of one pound of fuel to thirteen and a half pounds of water. The lowest class of English oil was used, and gave a flame more voluminous than intense.

The evaporative value of a fluid can be better calculated from a careful chemical analysis, than by testing it under a boiler as fuels consist of carbon and hydrogen. Carbon has an evaporative power of 15, and hydrogen of 69. Multiply these by the respective amounts of them in the fuel, take the sum, and this will be the best possible evaporative value of the fuel.

The friction of a smooth disk revolving in water is about 2.150th of its weight.

A FORTUNATE FIND.—A casket of diamonds and other valuable jewels were found near Nashville on the 27th of June. Their value is estimated at \$80,000. Samuel J. Ringold was the finder. There were no marks found which could indicate who the jewels belonged to. They had evidently been lying for several years just under the surface of the ground.

Scientific Miscellany.

CHANGES ON THE MOON'S SURFACE.—The Rev. T. W. Wehh has recently called the attention of the "British Association" to a remarkable valley in the northern part of the moon, which Schroter, the old Hanoverian astronomer, had observed, drawn, and named Cassini. Mr. Webb identified this valley in January, 1865. Mr. Birt has since examined that portion of the moon carefully, compared it with Schroter's drawing, and ascertained that if Schroter's drawing was made correctly, enormous changes must have taken place on the surface of the moon during the past thirty years! Careful photographs are now being taken of the moon, at short intervals, and will be continued in the future, with the hope that by such means changes, if any are occurring, may be noted and their time fixed and character determined.

In this connection we may state that, among the noble uses to which female genius may be put, is that of watching and copying the subtle changes which pass over the face of nature. Acting upon this suggestion, Miss Beckly, a daughter of the mechanical assistant in the observatory at Kew, England, is thus employed; her special field of observation being the sun, all the changes on which she records from day to day, by means of his light. During the day she watches for opportunities for photographing the sun, with that patience for which the sex is distinguished; and we have the authority of the President of the Astronomical Society for saying, that she never lets an opportunity escape her. It is extraordinary, that even on very cloudy days, between gaps of clouds, when it would be imagined that it was almost impossible to get a photograph, there is always a record at Kew.

COSMICAL DUST.—The celebrated Dr. Reichenbach, of Vienna, thinks he has discovered a genuine "universal powder," or dust, which pervades all interplanetary space, and which, when it becomes agglomerated, forms large or small meteorolites, while at other times it reaches the surface of our earth in the form of an impalpable powder. We know that meteorolites are mainly composed of nickel, cobalt, iron, phosphorus, etc. Well, Dr. Reichenbach went to the top of a mountain, which had never been touched by a spade or pickaxe, and collected there some dust, which he analyzed, and found it to contain nickel, cobalt, phosphorus and magnesia. People have wondered where the minute quantity of phosphorus, so generally distributed on the surface of the earth, came from. The doctor, however, has discovered it in the mysterious invisible rain, which henceforth must be looked upon as quite as necessary for vegetation as the water which falls from the clouds.

A STREAM OF MALACHITE.—A stream of malachite (green carbonate of copper in solution) is said to have recently made its appearance in Cornwall, England. A stream of water issuing from several lodes of hematite and white iron ore, has suddenly changed its appearance from the red color produced by red oxyd of iron to a green color, and now presents a stream of the strongest copper or mineral water ever seen probably in any country; in fact the whole beach where this stream runs over, and everything it comes in contact with, are as green as malachite, to the astonishment of every one who has seen it, and quite a sensation has been caused in the neighborhood. The inference is that something volcanic has occurred, and that this water is issuing from a great deposit of copper ore not yet discovered in some of the parallel lodes.

THE COLOR OF WINE.—The red color of wine can be proved to be artificial or true by simply dipping a small piece of bread or sponge into the liquid and placing it in a glass of clear water. If the color is artificial the water will be at once colored, but pure wine will not color it for half an hour or more. The sponge should be well washed beforehand.

OZONE is found to be developed by the mechanical action of blowing machines—a fact which may partly account for the healthfulness of winds.

PLATINUM MIRRORS.—SOMETHING NEW.—A process has been patented in France by M. Dode, a chemist, for the manufacture of platinum mirrors, which are greatly admired, and which present this advantage, that the reflecting metal is deposited on the outer surface of the glass, and thus any defect in the latter is concealed. The process is very expeditious. A single baking, it is said, will furnish 200 metres of glass ready for commerce. It would take fifteen days to coat the same extent with mercury by the ordinary plan. A reduction of from 40 to 100 per cent, in cost of looking glass is expected to result from the adoption of this process; for any glass, even the common bottle metal, will serve to be coated. The process is conducted as follows: "Chloride of platinum is dissolved in water, and a certain quantity of oil of lavender is added to the solution. The platinum immediately leaves the aqueous solution and passes to the oil, which holds it in suspension in a finely-divided state. To the oil so charged litharge and borate of lead are added, and a thin coat of this mixture is painted over the surface of the glass, which is then carried to a proper furnace. At a red heat the litharge and borate of lead are fused and cause the adhesion of the platinum to the softened glass." —*Mechanics Magazine.*

CRYSTALLIZATION OF IRON.—Under the influence of reiterated trepidation the iron of rails constantly gone over by rapid trains assumes a crystalline form; the axles of the wheels do the same, and the places towards which the least coherent particles converge during this continual vibration become the points where fracture occurs. The repeated explosion of gunpowder in the chamber of a piece of ordnance modifies the cohesion of its metallic particles, and at length causes the fracture of the mass. According to M. Kuhlmann, a tenacious fibrous quality of sheet iron, out of which a steam boiler was made, in a short time became crystalline and brittle by the constant trepidation caused by the evolution of steam.

PRESERVING GRAIN.—A new system of preserving grain has recently been adopted in France. The grain, flour, biscuit, etc., is placed in large iron cylinders, from which the air is subsequently so much exhausted as to render it so rarified as to destroy even the weevil, the most difficult of all corn parasites to subdue. During a six months' trial none were developed. The apparatus is considered available for any length of time, and under the most unfavorable circumstances.

PHOTOGRAPHY IN COLORS has progressed so far that a doll dressed by the operator can be perfectly reproduced on the plates. A greater triumph is photographing a peacock's feather. It has been found that none but pure colors take well, those that are made by a mixture of two primary colors giving but one of the primaries on the plate. These photographs will not stand a full light long, as they turn brown, but may be preserved in an album.

The outer covering of the bulb of the *anemole*, or California soap plant, has been applied to a useful purpose. It is now being collected in considerable quantity and sent to this city, where it is used for filling mattresses, and in the manufacture of brushes.

An error in placing a fine dot which fixes the length of a base line in astronomical measurements, amounting to 1-5000th part of an inch, will amount to an error of seventy-six feet in calculating the diameter of the earth, 360 miles in the sun's distance, and 65,800,000 in the distance of the nearest fixed star.

If a tube connected with water, and a solid rod also connected with water, be applied at once to the ears, sound will be heard only in the ear supplied with the tube. The reason is that the tube is so much the better conductor that it kills whatever sound is transmitted through the rod.

It has lately been discovered that the whole of the sulphur, used at present in illuminating gas (and which makes that gas so offensive) may be removed by bringing it in contact with the ammoniacal liquor which is an almost worthless product of the same gas works.

A VIENNESE philosopher is experimenting upon the transportation of ponderable bodies by electricity, so that the old fable of the soldier who sent his shoes home for exchange by hanging them on the telegraph wire, may be realized.

ANILINE.—It requires as many as 2,000 tons of coal to produce a circular hock of aniline twenty-four inches high by nine inches wide, but this is sufficient to dye three hundred miles of silk fabric.

When water is hoiled under oil and the steam collected and condensed a bubble of gas remains, which is found to be nitrogen, proving the absorptive power of water upon gases.

SALES OF THE WEEK

BY THE S. F. STOCK & EXCHANGE BOARD

Friday, July 20.

AFTERNOON SESSION.

4 shs Savage at \$95 per foot.

SAN FRANCISCO, SATURDAY MORNING, July 28th, 1866.

The Money market has undergone no material change since our last reference. A slightly increased activity is perceptible in some quarters, growing out of an interior requirement for the movement of the crops, but capital is very abundant, and readily found upon good paper and other collateral at 1½¢ per month in bank.

Receipts of treasure from the interior mining districts continue good, and for the month of July will exceed \$4,200,000.

The market is well supplied with bullion, and the demand not active as yet for Monday's steamer. Gold bars have been taken to account this week at \$70@80, and Silver is ranging from ¼¢ discount to ¾¢ premium—the latter for choice bars.

The rates of Exchange on the East do not vary materially from those ruling last week. Currency bills on the Atlantic are offered at 44¢ cent. premium on gold. Sight drafts, payable in coin, are selling at 2@2¼¢ cent. premium, and Telegraphic Transfers are made at 2¼¢ cent. premium. Sterling Exchange is quotable at 48¼¢@48½¢, for best Bankers' bills.

Legal Tenders have been active at 71@71½¢, closing at about 71¢. Our latest telegraphic advices from the East quote Gold at 149 in New York, on the 21st instant.

The Share Market presents a rather more cheerful view than at the close of last week. A number of leading stocks have been dealt in at higher prices, and are strongly held at the close. Nearly all productive mines on the Comstock are looking as well as at any former period during the year, and their net earnings for this month will exceed those of June.

City shares for the most show a slight improvement, and are not freely offered except at full rates. California Steam Navigation Company rose from 60 to 65, and then sold at 66. Spring Valley was sold at \$65 per share, and North Beach and Mission R. R. at \$45. For Omnibus R. R. \$52 is bid. Fireman's Fund Insurance is offered at 114; Pacific Insurance at 178, and National at 78. San Francisco Gas is inquired for at 119, and State Telegraph at 31 per share.

Hale & Norcross is in decided favor, and very firmly held. Small sales were made at \$1,425, seller 30, closing at \$1,500 asked. Advices from different portions of this mine are exceedingly favorable. A connection has been made between the north and south stopes on the 12th floor of the 700-foot level, and in breasting out toward the south, on the 535-foot level, the lode continues to improve. The yield of bullion, from the 1st to the 23d instant, exceeded \$100,000, and the aggregate receipts for the month will probably reach \$130,000.

Savage is also in better request, advancing from \$897½ to \$960, and then selling at \$950. During the week ending 21st inst. 717 tons of ore were extracted, and 822 tons shipped from the mine. The company have now some \$50,000 at their credit, and a dividend will soon be declared for the month of July.

Gould & Curry met with trifling sales at \$695@745, closing at \$705. The 100-foot level (1st station below lower tunnel) is thought to look quite promising, the ore appearing to grow wider, and some portions richer. The quartz on the 2d station in which the incline is started is said to present favorable indications for a body of ore, but as yet metal has been found only in small spots. If ore should be met

with at that point it would be a new development, and one of importance. Receipts of bullion to the 25th instant amounted to \$93,000, and the aggregate for the current month will exceed \$125,000.

Crown Point rose from \$745 to \$840, and closed at about \$875 asked. Improvements to the shaft will be completed this month, and the Rhode Island mill will probably be running on the 5th proximo. From the "croppings" through the old tunnel, at a depth of 70 feet from the surface, 65 to 70 tons of ore are now taken daily. The bullion yield of the company for July will amount to some \$50,000, leaving a handsome surplus on hand.

Yellow Jacket rose from \$550 to \$590, and then sold at \$570@565. The total receipts of the company for the year ending June 30th last, amounted to \$2,072,814. The yield of 53,526 tons 1st and 2d-class ore worked, was \$1,690,394—an average of \$32.50 per ton; and 1,479 tons 3d-class ore were sold at \$3.20 per ton. From assessments levied \$300,000 were derived. The indebtedness of the company, June 30th, 1865, was \$379,771.55, and the total expenses from that date to June 30th, 1866, amounted to \$1,550,127, leaving a balance on hand at the close of the year of \$142,915.38. During the two weeks ending 16th and 23d instants, 4,126 tons of ore were reduced, yielding \$105,836.27, making an aggregate of \$154,348 for the first three weeks of this month.

Ophir is in less favor, and some 150 feet were dealt in, advancing from \$285 to \$300, receding to \$240, and then selling at \$242@245. But little work has been done this week upon ore in the 8th gallery, owing to the timbering of a track connecting the drift with the vein. Receipts of bullion for July will amount to some \$50,000, giving a fair profit over all expenses.

Chollar-Potosi was inactive and dull until yesterday, advancing from 184 to 190, dropping to 180, and closing at \$177. The Piute station is said to look as well as formerly. In the northern part of the Bajazette Ground ore is being taken down within ten feet of the Hale & Norcross line. This body of ore is 40 feet in depth, and a portion of it good quality. The Santa Fe station continues to produce some fine ore. The 1st station drift north from the new shaft is in hard ground, and progressing slowly. The 2d station drift north branch is 326 feet, and the south branch 272 feet. During the week ending 21st instant, 796½ tons of ore were sent to custom mills.

Belcher fell from \$160 to \$140, and closed at \$140 asked. Alpha was dealt in at \$99@100, and Empire Mill and Mining company at \$115@112, the latter closing with more firmness.

Imperial met with trifling sales at \$94@90, closing at \$91. Receipts of bullion for the first three weeks of the month amounted to \$36,809, and the aggregate for July will probably exceed \$60,000. A body of low grade ore, 40 feet wide, has been found at a depth of 150 feet from the surface, in what is known as the red ledge of the Alta mine, and from the Holmes' ground efficient is being taken to keep the Gold Hill mill constantly at work.

Nearly 3,000 shares of Overman have been sold within a range of \$32@49, closing at \$36. Confidence fell from \$55 to 50½¢, and then sold at \$55. Bullion was dealt in at \$47@49, closing at \$47.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday, amounted to \$314,292.

AMERICAN MINING STUDENTS IN EUROPE.
It is said that there are now, or were before the commencement of the present European war, thirty-five American students at the celebrated school of mines in Freiberg—more than a third of the whole number in attendance. About half this number are said to be hard-working and studious young men, who appreciate our need of intelligent mining engineers and who are determined to do what they can to worthily fill that want. One-quarter of the whole number are taking life easily, while the other half appear to be profiting but little, if anything, from the advantages placed before them. A college at home is bad enough; but an institution of that kind abroad, and in a community where little moral restraint is thrown around the young men, there is no limit to the recklessness which may be indulged in by those who have plenty of money and but little self-restraint. We quote the above from a correspondent of the Chicago Tribune, who has recently visited Freiberg.

OLD MINES RE-DISCOVERED.—In Brazil, in the town of Rio Grand do Sul, old silver mines worked by the Jesuits have been re-discovered. There are said to be in the Southern part of California, also, silver mines of the greatest richness, which were worked before the formation of the Mexican Republic with great results, all traces of which were carefully concealed when the priests, who had taken the profits of them were compelled to leave the country. The Indians were put under oaths, with fearful penalties, not to disclose the location of them.

A HARVESTING MACHINE.—The Contra Costa Gazette speaks well of a new harvesting machine, recently invented by Mr. Dalton, of Pacheco, and designed for reaping, thrashing and sacking the grain at one operation. The machine will run with three men and ten horses; and, adds the Gazette, though some minor difficulties may be looked for on first trial, they cannot prove so serious as to baffle the resources and determination of the inventor, who has set out with the purpose of surpassing any machine yet applied to the entire process of harvesting grain.

A BORING MACHINE.—Edward Duffy, a mechanic of this city, has invented a machine for manufacturing inner and outer window blinds, which bores 460 holes in a minute, and does it better than the same work can be done by hand. He has applied for a patent for his invention.

UNDERGROUND RIVERS.—There are said to be underground creeks in the limestone regions of Georgia with currents of sufficient velocity to carry a mill. There is a Government tannery, the bark mill of which is driven by one of these subterranean streams.

The latest Chicago swindling enterprise is a gold mining company of five hundred thousand shares, at one dollar per share. The territory to be worked is alleged to be somewhere in Western Kansas.

The San Francisco Mining Press, one of the ablest journals of its kind in the country.—[N. Y. Stockholder and Mining Herald.]

Change in Prices.

Single Copies of the MINING AND SCIENTIFIC PRESS will hereafter be sold at FIFTEEN (15) CENTS. By City Car Jers, 60 Cents per month; Monthly Series, 65 Cents. The rates of Yearly subscriptions, at the office of publication, remain as heretofore—\$5 per annum. The price to News Agents will be advanced 1½ cents per copy. Agents in the Interior supplied. June 30, 1886.

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been organized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

STOCK CERTIFICATES, STOCK TRANSFER JOURNALS, STOCK LEDGERS, ASSESSMENT RECEIPTS,

And all other Blanks, Black Books, etc., required by Mining and other Corporations, kept on hand or printed to order on short notice, at moderate prices, at the office of the MINING AND SCIENTIFIC PRESS.

MINING SHAREHOLDERS' DIRECTORY,

[Compiled for every issue, from advertisements in the MINING AND SCIENTIFIC PRESS and other San Francisco Journals.]

HUNGERFORD'S IMPROVED CONCENTRATOR,

FIG. 1.

For Saving Gold, Sulphurets, Quicksilver, Etc.

FIG. 2.

There is no description of machinery of so much importance to the mining interests of California, at the present time, as that for the separation of sulphurets. Mines are now abandoned, or, what is worse, paying assessments which, if the sulphurets were saved, would yield handsome dividends. Great difficulty, owing to the varied form and character of the sulphurets, has been experienced in devising a machine to separate them, and it is only by close and patient observation, persevering study and careful experiment, that any machine can be made or matured so as to save a high per centage of the sulphurets which are in the ore. No machine is so perfect as to save all; and the best is that which will save most with the least expenditure of time, money, and power. Many machines have been tried, and many abandoned; all of which have been unable, so far, to attain a profitable separation, and meet the requirements of the mining interest, so well as that now patented by Mr. Hungerford, which is an improvement on the well known Hungerford & Prater Concentrator, with which his name is already so familiar.

The separating or concentrating action is obtained by centrifugal force and gravitation; the pulp being preserved by water in the proper condition for the operation, and the pan so constructed, mechanically, as to allow the centrifugal force and gravity to expend themselves to the best advantage in producing the separation, as well as to make the machine simple, compact, and easily kept in order.

Fig. No. 1 is a perspective view of the Concentrator while in operation, showing the general arrangement. Fig. No. 2 is a section through the centre of the pan, showing how it operates in separating the sulphurets, as well as the great improvement to the pan, which consists of the addition of a circular trough outside the periphery.

Its operation is as follows: The pulp flows from the spout through the filter into the bowl at the top, from which it is distributed equally over the convex cover into the pan near its outer edge. The lightest sand is at once carried off with the overflowing water through the centre opening, and the sulphurets are allowed, from the motion given to the machine, to gravitate to the bottom toward the outer edge, forming an embankment all around the pan, as represented at 1, 1, Fig. 2. The lighter particles of the sand arrange themselves on the top at 2, 2, Fig. 2, from which they are being constantly washed away with the water flowing through the central opening. The sulphurets are, by the centrifugal motion of the machine, made to pass through small openings at intervals in a few inches around the circumference, through the inner wall of the pan to the circular trough, 3, 3, Fig. 2, where they come in contact with the mercury at the bottom, depositing the free metal, from which it is drawn at pleasure by an opening in the bottom, and the sulphurets, in the order of their density, by openings in the sides.

It will be observed that the sulphurets in the trough, 3, 3, are maintained at the same elevation as the sulphurets and overlying sand in the body of the pan. It will be further observed, that by no possible means can the sand in the latter pass to the former in such quantities as to form any considerable percentage of the amount saved. The advantages of this improved pan are continuous action, requiring no attention except to remove the receiving vessels as fast as they are filled from the openings shown at the right of Fig. 2, simplicity in construction, and durability and cheapness of cost.

The pan derives its motion from two eccentrics secured on a horizontal shaft passing across and below the centre of the pan and working between two pairs of adjustable wooden guide blocks or bearings. The eccentrics are so made as to bear equally on the wooden guide blocks in all positions while in motion; giving to the pan the most desirable motion for its purpose, and doing away with all complexity of rods, cranks, wooden frame, etc.

These pans are now being introduced into the best mills in the country. Reference to parties who have tested them can be had by applying to the manufacturers.

Those interested in mining, and who call at the Miners' Foundry to see the one which is there in operation, will have no reason to regret their visit.

Notary Public and Searcher of Records.
Office, "Betsy House," (directly opposite the Court House),
San Leandro. 19v12-3m

Preparing for Publication.

A complete History and Directory of the

Central Mines of Colorado.

And the towns and cities in their vicinity.

PERCEIVING THE GREAT ADVANTAGE TO COLORADO a pamphlet, historical and descriptive of its central and most important mines would be at the present time, the subscriber has undertaken to publish such a work.

It is designed to fix for the future the discovery and early history of the mines, to sketch their progress and present condition, to give such statistics as are attainable with regard to their production, actual and possible; in fine, to disseminate throughout the East and in Europe accurate information respecting them. To relieve the tediousness of such a work, interesting incidents illustrating the early manners and customs of the pioneers, and the gradual organizing into its present consistence of the first and always to be the eminently Rocky Mountain State, will be given.

It is also designed to contain a complete Directory of the towns of Central, Black Hawk, Nevada, Colden City, Idaho, Empire, Georgetown, Cold Dirt, and South Boulder; views of each of those places; separate views of the principal buildings, public and private; also views of mills and mines and of mountain scenery.

There will also be attached a Business Department, in which a limited number of advertisements will be inserted.

O. J. Hollister, of the Black Hawk Mining Journal, has been engaged to compile the body of the work—the historical and descriptive narrative. Having been here uninterruptedly for the past six years, and mingled freely in perhaps every walk of life, he trusts he will be able to do the subject ample justice.

All old residents of this region who are familiar with the discovery and early history of the mines, or with interesting incidents of that indefinite time known as the "early day," will confer a favor on the subscriber by furnishing such information to O. J. Hollister, Journal office, Black Hawk, Colorado.

The work will be issued during the month of August. Price \$2, bound in paper; in muslin, \$2.50.

Address, G. M. BINKLEY.

May 10th, 1886. Central City, C. T.

By Express.—Two cents per copy will be added to our usual rates of subscription (to pay Wells, Fargo & Co.'s tariff) on papers sent by express. If connecting expresses in the interior make additional charges, subscribers must themselves settle the same.

Mining Summary.

CALIFORNIA.

Alpine County—

The *Ledger* of July 21st, has the following: The proprietors of the Keystone mine have just completed one of the finest quartz mills in the State. They use a 60-horse power engine and two tubular boilers, and are now running twenty stamps. It is the intention to erect twenty more stamps as soon as the machinery of the old mill can be removed.

A recent visit to the principal quartz mines at and in the vicinity of Sutter creek, confirms us in the opinion, so often expressed by ourselves and others, that they are the best developed and best paying mines on the Pacific coast or in the world. The main shaft on the Eureka is now over 1,200 feet deep, the ore richer than at any other depth, and the only perceptible difference being in the more general diffusion of the gold through the ore. The Old Union mine, owned by Stanford, Downs & Co., is now down about 700 feet, and is daily and rapidly progressing. The Mahoney mine is as rich as ever. We were shown two halls of retorted gold, the result, if our memory serves us, of two weeks run, weighing severally twenty-five and thirty-five pounds. There are two shafts on the Mahoney mine of the respective depths of two and four hundred feet. The lode is of leviathan proportions, being in many places from thirty to ninety feet in width. Wildman, Wheeler & Co. are untiring in their efforts to develop a good mine, and their faith is as unflinching as their energies. After sinking 530 feet, a drift was driven easterly seventy feet, and then westerly thirty feet, with fair prospects of getting the foot wall. The Railroad is now down nearly 300 feet, and the vein is still widening and daily growing richer. In the No. 1, the depth of the main shaft is 113 feet, with levels 200 feet in length. The vein is from two to eight feet in width, and the last run crushed under the management of Mr. Downs, yielded sixteen dollars to the ton and of a fineness of \$61. Northeastly from the Number One is another new discovery believed to be on the Coney lode, and owned by Rev. J. H. Miller, Littlefield and others whose names we did not learn. The quartz and surrounding rock, both of this and the Washington, are evidences of their sameness with the Coney and Blue Jackets.

Calaveras County—

The *Chronicle* of July 21st, has these items: On Sunday last we were shown the gold—185 ounces—taken from Reed & Co.'s claim during a short run. This claim is located near the north fork of the Mokelumne river, on the West Point range, and is proving itself to be one of the richest in the county. The rock was crushed at Harris' mill, near Sandy gulch. The greater part of the gold taken out at West Point is sent below by the way of Volcano, and goes to swell the returns of Amador, instead of being placed to the credit of this county, where it belongs. . . . We were shown this week, some rock from the celebrated claim of Beals, Butler & Co., at Railroad Flat. We never saw any rock which had the precious ore so generally diffused through it. The vein has been taken up for a distance of five miles. . . . After crushing a hundred tons of rock taken from their claim in Spring gulch, near Mokelumne Hill, Lamphar & Co., cleaned up on Monday last. We are not informed as to the exact amount obtained, but are apprised that the yield was even greater than before.

From the Copperopolis *Courier* of same date, we clip these items: Mr. McGlynn has commenced to crush quartz rock from his lead near San Andreas. The prospects are flattering. He has a lead about four feet wide, at a depth of twelve feet, but the rock is full of sulphurets, which will render it difficult to save all the gold by the ordinary method. . . . The Alban Ranch claim, according to accounts, is now paying handsomely.

Mariposa County—

We clip the following from the Mariposa *Gazette* of the 21st instant: A correspondent writing from Hunter's Valley, under date of July 14th, says: "Everything in the valley is moving on slowly. The Potts mine is paying well. Barrett's mill is crushing day and night, and cannot crush half fast enough. The Floyd mill is standing still, and will not start until ordered at headquarters."

Messrs. Coffey, Risdon and Haskell, are about to erect smelting works near the La Victoire vein, in Hunter's Valley.

Mono County—

The Partzwick correspondent of the *Alla* writes, July 29th: "This section of our mineral region has been little noticed in the press. Situated about fifty miles south of Aurora, on the high road to Owensville and Kearsarge, it possesses many advantages in addition to its rich mineral wealth. The ore is adapted almost exclusively for smelting. From some of the leads opened the richest yields known have resulted. The Diana claim averages over \$250 to the ton. This company work their rock

with a small 4-stamp mill, and find as much left in the tailings as they receive in the amalgam. The Sierra Blanca company's claims—the Crocker and Elmira—yielded by smelting process a trifle over \$300 per ton. The Cornucopia lead is being thoroughly and systematically opened. Five shafts are sunk, at a distance of one hundred feet apart, to depths of from one hundred and twenty to one hundred and eighty feet, and at every sixty feet a gallery is run connecting the whole of these shafts. No ore has been taken out except that necessary in running this work, as the company wish to thoroughly open the mine before stoping. The lead is a good one, well defined, and the pay streak is very rich. In a short time they will have their smelting furnace up, and then the results will show, without doubt, the wealth of their claim. The Kearsarge is another very rich lode; the Camanche and a host of others could be named, but it is sufficient to say that all are satisfied with the value of this section of the country. All we need now is some cheap method of extracting the precious metal. At Silver Peak, Martin has been eminently successful with his small mill, and is now about erecting one of forty stamps."

Nevada County—

The *Gazette* has these items: Four tons of Banner rock, crushed last week at Stiles' mill as a test, yielded \$48 per ton. The incline is now down to a depth of one hundred and sixty feet, which is about one hundred feet in perpendicular depth. The new mill of the company, after considerable improvements and re-arranging, is now running satisfactorily. . . . We learn that the Willow Valley company, who have been running their incline under the ledge, commenced drifting for it on Thursday, and after running eight or nine feet struck the vein Saturday afternoon. The ledge is about four feet wide, and the rock is apparently better than that taken from near the surface. The incline is sixty feet below the old tunnel, and a hundred and twenty feet below the surface. . . . The Grant ledge promises well. A shaft has been sunk upon it to the depth of fifty feet, and a tunnel run from the bottom of the same a distance of about thirty feet, from which twenty loads of rock has been taken, which yielded about twenty-one dollars a load. The sulphurets have been found, on assaying, to pay as high as one hundred dollars a ton. . . . A crushing of four and a half tons of rock from the Eureka ledge, at Grizzly ridge, was cleaned up at Stiles' mill on Tuesday, and yielded \$246—equal to \$54.67 a ton. This rock was brought down and crushed as a test. . . . The Ophir mill, which has been idle for a week or ten days, was started up again, a day or two ago, and the machinery is now working beautifully. . . . The surveys necessary for commencing operations on the claims of the Chalk Bluff Blue Gravel company are to be made at once.

The Grase Valley *National* says: Woodworth & Co., at Osborn Hill, are now taking out some very rich rock from the old ledge. They are now down about two hundred feet, the ledge is from one to two feet thick, and the rock will pay from one hundred to two hundred dollars a ton. . . . On the Utah ledge, a tunnel has been run in some four hundred feet, and an incline shaft is now being put through the ledge. We have been shown much rich rock from the Utah, taken from the bottom of a shaft twelve feet below the water level.

The following is from the *Union* of July 18th: The Cambridge mine, which was sold a few months since to W. H. V. Cronise and other quartz operators of San Francisco, is now being opened in a thoroughly workmanlike manner, and it promises to be one of the best mines in Grass Valley Township. The Cambridge is located on Howard Hill, about one mile and a half easterly from Grass Valley. Since the new proprietors have come in possession, splendid hoisting, pumping and reduction works have been erected. The incline shaft is now down 158 feet. The mill will be started when the depth of 230 feet, or 100 feet below the old works, is reached. The ledge, where exposed at the foot of the incline, is about eighteen inches thick, and looks splendidly.

The Italian ledge company had some rock crushed, which paid fifty dollars per ton. The ledge is two feet wide. . . . The Dead-Wood company have reached a depth of fifty or sixty feet. They hoist by hand, and raise the water by a 6-inch Hansbrow pump. They have a large ledge, which they are working in two places. The surface rock pays \$50 per ton, and is more than paying the expenses of sinking the incline.

Excelsior.—A correspondent of the *National*, writing from Meadow Lake, July 18th, says: "Since writing my last letter I have been among the mines of this section of the country, and find that within the past two weeks our miners have made great progress toward the opening of their claims, and the result is very flattering generally. In most of the claims being prospected the ledges improve in appearance as they are opened."

Placer County—

The *Herald* of July 21st, says: The Charlee Mallott ledge increases in richness as they go

down. The shaft is now sixty feet. . . . On the Taylor ledge, a depth of nearly 100 feet has been reached, and the rock shows well at that depth. Every indication shows this to be a well defined and valuable ledge. . . . The "Conrad" hoys have gone to work again, and are taking out rich rock.

Pinamas County—

A correspondent of the *Marysville Appeal* writing from Nelson Point, July 18th, says: There has no company got into the river as yet; that is, none have commenced washing. The Glandiam Rocky Bar company (Chinese) have the water running through their flumes. Also, Shubert & Co., in Nelson creek. Ullermann & Co., in their high-bar claim—hydraulic diggings—on Nelson creek, have been doing well, and are going to flume the creek; also Reed & Co., the claims near the Willow ranch, are cleaned up; that is, as much as they are going to be this year. * * They got some heavy gold, \$25 and \$39 pieces. Some boxes, I know, yielded considerably over \$100 each—but all they say is, "We have done very well"—probably not wishing to make a show. Hardy & Brown, on Chip Flat, have not yet cleaned up.

San Bernardino County—

The *Alla's* correspondent writes from Slate Range, July 8th: The Argus district at this moment contains larger lodes, richer silver ore, a greater abundance of water, and is nearer to civilization, with good roads, than any district I know of, and I have traveled as extensively as any miner in California. The lodes are well defined, the ores principally argentiferous galena, easy of extraction, and yet there is not at this time a single miner in the district. This should not be. We surely ought to give this district a trial. Let some scientific miners come out here, and we will show them where fortunes can be made, with less expense for freight, fuel, etc., than in either Washoe or Reese River; aye, and far richer ore. Then there is on the south the El Paso district—not even scratched—with ores of the same quality that assay \$900 to \$1,100 per ton, and an inexhaustible supply of copper ore, and there is not a single soul, at this time, in the district. * * It is only eighteen miles from the Argus to the Telescope district, thirty miles from Slate Range to El Paso, twenty-five miles from Slate Range to Death Valley, and forty-five miles from Slate Range to Walker's Pass, all good roads, and water within reasonable distances, and vegetables and grain can be bought cheap in Lion's Valley, only a short distance from Walker's Pass.

Shasta County—

The following is from the *Courier* of 21st inst.: A correspondent at South Fork furnishes the following items: The Crystal company have a shaft down about thirty feet. The ore is said to be very rich. Work has begun upon the Great Falls with a view of determining its value. The Dayton and its extensions show fine rock, and are rapidly assuming position with the earlier discoveries. The Whig and Black Jack are recent discoveries, and show good mineral. Arrangements have been perfected to commence work upon the Eclectic series next week. Work is being pushed ahead upon the Big Central with prospects that rank this mine next to the Chicago. The Chicago company have exposed a body of ore that cannot be beaten anywhere at the same depth. They have drifted in beside the middle ledge about thirty feet, leaving the ledge standing about ten feet in depth from the surface. The ledge is something over three feet between "flukins"—one streak about fifteen inches wide is over half mineral—probably two thirds. Judging from the result of ore already tested below, this body of ore is believed to be worth \$1,000 per ton in silver. The rock outside of the "streak" all contains mineral in ordinary quantities. All pronounce it the richest average deposit they ever saw.

The Quartz Hill claim, belonging to the Mammoth company, is being worked with splendid prospects. On Tuesday we saw half a pound of the rock crushed and panned out with a result of fifty cents, the workman who brought it in declaring that it is no more than average rock.

Sierra County—

The Alleghany correspondent of the *Mountain Messenger*, says, July 14th: Our town never seemed more prosperous. The Union mill is running, and the company are in high spirits. The Twenty-One mill has been in operation for some little time. Gov. Newell is likely to complete his mill on the New York Greenback ledge. It is reported that the Oak Flat company have sold for \$40,000; that is much lower than we expected. The Fac Simile company will strike the ledge in the lower tunnel next week, if the survey was correct. The Fremont company is progressing finely.

We understand that the Wheeler quartz mill, just above town, is now thoroughly repaired, and that Mr. Hall will start it on pay rock as soon as the crevices in the batteries are filled. The rock on the dump looks as though it would pay. Mr. Hall is pushing

vigorously ahead for another ledge, which is confidentially believed to exist at no great distance in the mountain.—*Messenger*.

Siskiyou County—

The Yreka *Union* of 21st inst., says: Dr. Furber showed us a piece of quartz, or rather gold with quartz in it, the other day, which was taken from Schlee's lode at Cedar Gulch. The piece weighed \$27, and the Doctor stated that there were plenty more just like it in that lode.

Yuba County—

The Marysville *Appeal* of July 24th, has the following: Our old correspondent, "D." who is a miner at Brown's Valley, sends us the following items: "The Jefferson company has, to-day cleaned up \$14,000, and if I am rightly informed, this is the yield of about 600 tons of quartz, which have been crushed at their mill during the last 16 days. The quartz taken from this claim during the last eight months, has on an average seldom paid over \$15 to the ton. The clean up on the beginning of this month has already been an improvement, for it averaged \$18; and as to the present crushing, that above mentioned, it shows a little further improvement in yielding \$23 per ton. The extraction and crushing of this quartz is comparatively cheap, \$4 per ton will nearly cover all expenses whatever of mining and milling.

A correspondent of same paper, writing from Timbuctoo, July 22d, says that place is by no means "played out." He instances Jack Warren's claim, the Antoine claim, owned by Sam. Peck, and the Babb claim, all of which are doing well, as proof of this. The Union company are not at present working, but extending their flume.

A new flume is being run, to drain all the claims. It will be 15 feet lower than the old one.

NEVADA.

Washoe—

The Gold Hill *News* of July 23d has this item: The Yellow Jacket mine still continues to yield large quantities of good pay ore, some of it being very rich. The total receipts of bullion last month amounted to \$292,274.

The traveling correspondent of the *Flag* writes from Virginia City, July 10th: "Standing on the divide between Virginia and Gold Hill, the observer gets a vision of mining industry that fills him with surprise and wonder—long lines of mills, one after the other in constant succession. The roads in all directions are thronged with teams engaged in hauling wood and quartz. Most of the mills are situated some distance from their respective mines, and the transportation of rock is by mule teams. The immense amount of bullion monthly taken from these mines is almost beyond reasonable belief, yet so expensive are the operations that the greater amount is eaten up by the expenses.

Reese River—

From the *Reveille* we clip the following items: "A new district, the Northumbeland, has recently been discovered and named. It is situated in the Smoky Valley range, is bounded by Smoky Valley on the west and Monitor Valley on the east, and extends ten miles north and ten miles south of the locations. Seven ledges were located by the party, all of which were grouped to an area of about half a mile, on the northern side of Charnock's Pass. The ledges are apparently large, ranging from five to ten feet thick. . . . An assay of ore from the Mount Airy ledge, Morry district, showed a value of \$548.41 per ton, and another of ore from the American Eagle, at the rate of \$1,101.35 per ton, and it is estimated that the entire ledge, as far as examined, will pay at the rate of \$200 per ton.

The "Nevada Giant" ledge, in Cortez district, lies on the west side of Mount Tenaho, about mid way of base and summit, and stretches along its front from north to south, bold and precipitous, a distance of six miles. The grand outcropping mass is distinctly visible for forty miles, as you approach it from Grass Valley. According to the observations of Professor Jackson, taken in 1865, Mount Tenaho is 11,500 feet above the level of the sea, and 7,500 feet above Cortez Valley. This extraordinary deposit of calcareous and quartzose matter presents the most extensive vein formation of which there is any knowledge. It exhibits the same features common to most metal-bearing veins. The richest ores lie near the foot and hanging walls, while the more regular deposit of a lower grade of mineral is held in the center of the vein. And the richest deposits invariably run transverse to the general stratification. The width of this giant vein cannot be less than 900 feet from the granitic formation to the point where the stratified form ceases.

Work has been commenced on the Twin Ophir Nos. 1 and 2, of the La Plata company. The rock is very peculiar. Sixty tons are to be worked at the Keystone mill, and it can be worked with ordinary ease anywhere near the assay, the value of the ledge cannot be estimated. It is thought by those who have

confidence in its easy reduction by roasting and amalgamation, that the value of the ledge exceeds anything yet discovered in the State of Nevada, and if so, is the most valuable mine in the world. . . . Following are the names of five claims in Danville district, with the assay yield of their ore: Vanderbilt, \$895.89 of silver per ton; Boulder Ledge, \$1,702.82; Monadnock, \$207.35; Maid of Erin, \$486.97; Green Monster, \$103.67.

The foundation for the machinery in the new Metacom mill is already laid. It is calculated to have the mill running during September, when fully one thousand tons of ore will be ready for it to operate upon, which will work from \$150 to \$180 per ton. The cost of the mill and other buildings and improvements will be about \$75,000. The Metacom company is a New York incorporation, with a capital of \$2,000,000 currency, of which \$100,000 in coin has been paid in. . . . The Buell North Star mine was closed yesterday for a brief period. It is the intention of the superintendent, Captain Phillips, to go eastward immediately in order to represent to the owners the necessity for additional working capital.

The Nye county News of July 14th has these items: The celebrated St. Elenn (Alvarez) mine, situated in Washington district, Nye county, was sold in this place on Tuesday last, at Sheriff's sale, for a little over \$15,000. The purchasers were Messrs. Knox and Dinsmore, of Austin, who held judgments, together with costs, for about the amount of the sale. It is probable that the property will be redeemed, as it is well known to be worth considerably more than the judgments for which it was sold, and the sum of \$75,000 in gold coin has been refused for the same. . . . An assay of Old Dominion ore, Hot Creek district, gave \$3,700 per ton. . . . In Union district, at Grantsville, a contract for running one hundred feet in the lower tunnel of the Great Eastern claim had just been finished, and another contract for running the same distance has been taken by the same parties, upon which work will be commenced immediately. The Knickerbocker mill, in a few days, will commence crushing ore from the Great Eastern, which claim the Knickerbocker company recently purchased.

Emeralds.

From the Union of 21st inst., we clip the following: We learn that the mines in Palmetto district are being developed as rapidly as the circumstances will permit, and are proving themselves richer than anything before discovered in that section of country. . . . From reliable parties just in from Silver Peak and the Palmetto district, we learn that the reports received here of the recent Indian disturbances in that region were greatly exaggerated.

Palmarazat.

Mr. Mell, one of the party engaged in the Palmarazat trip with Governor Blaisdell returned to Washoe City lately, says the Eastern Slope. He states that the prospects of that district for early and permanent settlement is hourly improving. Several smelting works are now nearly completed, and more than as many more companies will commence the erection of works within a few days. Mr. Mell discovered and located three different ledges of good promise. He informs us that within a distance of sixty or seventy miles both iron and salt are found in unlimited quantities and of remarkable purity.

The Vedette says Silver Cañon is already a considerable town.

Black Rock.

The Chico Courier of June 30th, says late tests have "demonstrated beyond a doubt the richness of the Black Rock mines. Working tests showed from \$200 to \$6,000 per ton. Everybody is excited, and we expect to see a great rush to the mines."

Owen's River.

The Visalia Delta of July 18th, has the following news from Kearsarge: We learn from Dr. Pond, who has just returned from Owen's River, that the first run of Captain Paul's mill produced between three and four hundred pounds of silver bullion, which the Captain immediately took to Virginia City. The next run was even richer than this, and the bullion, which was supposed to be only silver, proves to be rich in gold, being worth from \$3.50 to \$12 per ounce. The lodes in that vicinity are selling for cash at \$100 per foot.

IDAHO.

The World of July 7th, says: Mr. W. W. Chapman, Jr., brought to Idaho City, last Monday, the result of the last clean up of the Elk Horn Mill, amounting to over \$5,000. It made a handsome brick. . . . Raymond's mill was advertised for sale.

Letter to same paper, from Rocky Bar, dated July 3d, has these items: The Waddingham company, under the supervision of Mr. John A. Greene, are busy at work on the Confederate Star, and have a large quantity of rock now on hand which they will commence crushing on Monday next. . . . The Idaho company will also start their mill in a few days. . . . The Benam & Harris mill and the Victor company, situated on Red Warrior, commenced

running yesterday, the former crushing from the Wide West, which is very rich. They have a very large quantity of very rich ore from said ledge now in their mill, and have a six foot well defined ledge at a depth of 150 feet. . . . The mill of the New York and Idaho Gold Mining company will start on Monday next. . . . The 40-stamp mill of the Waddingham company has been sold in New York to a company holding interests in Yuba district, and will be moved there soon.

Letter from Ruby City to the Vedette, dated July 1st, says: The mines in this district are now being rapidly developed; there are at the present time ten mills in running operation; these mills run 100 stamps. The Oro Fino, Morning Star, Minnesota, and many other lodes are being worked successfully. The celebrated Poorman and Hay & Ray are proven to be the same. The N. Y. & O. G. & S. M. Co. have expended about \$20,000 in driving tunnels, following the Hay & Ray lode from their discovery shaft, about 750 feet, which will tap the lode at the Poorman's shaft, 250 feet below the surface. Numerous fine roads have been constructed around War Eagle Mountain, to facilitate the transportation of the quartz to the mills. The recent rich developments in Alturas county, in the Yuba district, are attracting much attention. While the placer mines of Idaho are being exhausted, the permanent interest, which is quartz, is opening up with great success. In the Flint district, about eight miles south of this point, arrangements are being made for the erection of mills. There are some extensive veins of quartz which give paying tests.

MONTANA.

A correspondent of the Idaho World, writing from Reynolds City, June 10th, says: "As to the country let me say this—Elk Creek is a partial failure. About thirty or forty claims on it will pay quite well, nothing big. There are quite a number of small gulches around here averaging about six or eight claims each, which are paying quite well—some of them from \$600 to \$1,000 per week to the rocker. These will mostly be worked out this season. Deep Gulch, which heads about two miles from here, and runs to Bear City, is prospecting quite well, and most of the claims where bed rock has been struck are paying very well. This will not be worked out before another season. Deep Gulch empties into Bear Gulch. Bear Gulch is almost undeveloped, the mining is deep, and hence claims are hard to open. The Bostick boys and Buck Miller think the gulch very rich, and that it will pay big for five miles. If so that will be a good mining camp. I am going over there to stop a while. All of the old Indians say this does not begin to compare with Boise Basin when it was struck."

A letter from A. H. Marshall, dated Nevada Creek, June 25th, says the Trinity Journal has the following: "The mines are good, what there are of them, but like hens' teeth, they are very scarce. From what I can see and learn, I have arrived at the conclusion that there was more mining being done in Trinity county at any time between 1855 and 1860, than there is in the whole of this Territory now. This is a long way from being a second California in anything that is desirable but grass."

COLORADO.

The Register has these items: Josiah A. Conlee is now sinking the shafts on the Hardesty, Hussey and Burroughs mines. He has also the contract to sink the Eureka, now nearly one hundred feet deep. The latter company are putting up hoisting apparatus. . . . F. R. Ford's smelting furnace, in Russell's gulch, is completed.

The Journal gives the results of the experiments with sodium amalgam. Mr. Bruce, who has two batteries, of six stamps each, used it for four days, in one of them, running the other with quicksilver only. He got one ounce and nineteen dwts. more gold in the former than in the latter. Mr. Emery tried it in the Naragossent mill before it shut down, using it in two out of four batteries of five stamps each. He obtained, in a run of three days, five ounces of amalgam more than in the other two.

The Deover News of July 4th, has these items: A party who have been mining on Beaver creek for the last four years, with indifferent success, have at last "struck it rich," and are now taking out at the rate of \$50 per day to the hand. . . . Gulch mining at Buckskin is again looking up. . . . Hibbard and Wilcox are working in Eureka gulch with a Dodge mill, with great success. Their present furnace is of the capacity of one and a half cords per day, and they say they save 95 per cent of the precious metals contained in the ores, as indicated by a fire assay.

Editorial correspondence of same paper from Empire, under date of June 27th, says: Clear creek is high from melting snow, yet it is fordable at favorable points. Very little mining is being done in its bars this season. At only one point—just above Idaho—did we notice preparations for extensive operations. . . . But few mills are in operation, though a number of new ones are in process of erection, or

receiving their machinery. This place shows more improvement than any other we have seen. Quite a number of new houses have been built and several large mills in the vicinity are almost ready for work. The people are sanguine and confident as ever, and we think with good reason. . . . At North Empire, the tunnel belonging to the Lubig company, is 288 feet deep. It has pierced three or four lodes, and is now within a few feet of the celebrated Tenth Legion. The Atlantic is in over 200 feet. It has an eight feet crevice, and yields in an old stamp mill, about \$150 per cord. The same ore assays \$800 per cord.

ARIZONA.

Recent correspondence of the Alta, says, June 15th: The Big Bug mill will be completed by the middle of July. It is a 10-stamp mill, erected by Burger & Co. . . . The machinery for the Sterling mill is on the ground, and it will be running in one month. It is a five stamper. The Viceroy mill lies idle, there being two superintendents who cannot agree in regard to its erection and management. . . . It is intended to work the rock of the Bully Bueno lode. The shaft on this lode is sixty feet in depth. . . . The Woolsey mill, near the head of the Agua Fria, has five stamps, and will be running in about fourteen days. The water wheel, fifty feet in diameter, was a failure, and a new one is to be built. . . . The Thunderbolt mill, for custom work, is being erected by Lamson & Moore. . . . The Occidental mill, with two stamps, is working the rock from the lode of same name, which is small but rich. . . . The Coulter & Tyson mill, for the Eureka mine, is being erected. Part of the machinery is at Le Paz, and the rest at the mouth of the Colorado. . . . The ores from the Tenth Legion lode are being worked by an arrastra run by water power.

The above mentioned mills are only for the reduction of gold ores. If we take into consideration the great disadvantages under which this country has labored, and nearly the entire absence of outside capital, we can but come to the conclusion that the erection of so many mills, within a year, speaks well for the confidence the people here have in the mines, and for the gradual, but steady progress of the Territory; much more so than the New York stock bubbles in Southern Arizona where over a million has been expended in injudicious works, in costly houses and machinery, and even in miles of telegraph, connecting the mines with the Director's office, while the mines, whence all this outlay of capital was to be repaid a thousand fold, were entirely neglected, or worked by men who never saw a mine before, and who lost the vein wherever the least irregularity occurred. . . . * * * Sury & Pacheco's mine, near Tucson, and the Picacho mine of Calmar, are worked by old settlers, with arrastras with success. . . . * * * The only bad feature about this section of country is, that the actual work on the numerous mines is not at all commensurate with the mill power going up; and here, as everywhere in the United States, the fatal idea seems to prevail that a mill and a vein, or lode, is all that is needed to ensure success, and but few see the necessity of an extensive opening of the lode at first, without which a lode is not a mine by any means.

The copper mines on the Colorado are attracting attention. A private letter from La Paz says the region around William's Fork is lively. Martin & Co. have ten smelting furnaces on the way up the river, and a large quantity of ore out. The Planet mine has a new superintendant, and is to be worked with more energy than heretofore. The Great Central will have their furnace running in ten days.

OREGON.

A private letter from Canion City dated July 9th, says: "This camp has fallen through within the past six months. Everybody and a boy have left for Blackfoot, and it looks deserted here. . . . * * * My partner is attending to the ditch, and I am running the mine. Wages are four and a half and five dollars per day. I hire ten men. Shall clean up in three weeks."

BRITISH COLUMBIA.

The Calaveras Chronicle of July 14th speaks of the return of a neighbor from Big Bend, and says: He informs us that the business men of Victoria and other places frankly admit that they created the excitement for the sole purpose of benefiting themselves.

From the Trinity Journal we clip the following: A writer from Westminster, who left Yale on the 26th, says: "Here we found every one from Big Bend who could get back—some without hat or boots, and scarce enough clothing to cover them. All gave the worst account of Big Bend, or 'Big Bilk,' as they termed it, that I ever heard of. I heard men offer a reward of seventy dollars for an ounce of Big Bend gold dust."

Idaho papers tell the same story.

A farmer returning home in his wagon after delivering a load of corn, is a more certain sign of national prosperity than a nobleman riding in his chariot to the opera.

Trades and Manufactures.

WM. BARTLING. HENRY KIMBALL.
BARTLING & KIMBALL,
BOOKBINDERS,
Paper Rulers and Blank Book Manufacturers.
505 Clay street, (southwest cor. Sansome),
15v12-3m SAN FRANCISCO.

JOHN DANIEL,
(SUCCESSOR TO O. GORD)
MARBLE WORKS.
No. 405 Pine st. bet. Montgomery and Kearny, San Francisco.
Monuments, Monuments, Tombs, Plumbers' Slabs
Etc., On hand and Manufactured to order.
Goods shipped to all parts of the State. Orders re-
specially solicited. 2v8-3m

NATHANIEL GRAY,
General Furnishing Undertaker,
641 Sacramento St., corner of Webb, San Francisco.
Bartow's Metallic Burial Caskets and Cases,
117

THEODORE KALLENBERG,
Maker of Models for Inventors.
MACHINES, MATHEMATICAL, OPTICAL AND PHIL-
OSOPHICAL Instruments, Scales, Weights, etc. Steel
Stamps, Dies and Die Sinking, Engraving Stamps. Repair-
ing of machinery promptly attended to.
No. 415 Market street, San Francisco. n7-1f

Palmer's Patent
ARTIFICIAL LEG,
Manufactured in Philadelphia, Penn.
JARVIS JEWETT, AGENT.
629 Washington Street, San Francisco, Cal. 10v8-1m

SAN FRANCISCO MILL.
HOBBS, GILMORE & CO.,
MANUFACTURERS OF
BOXES!
Market street, between Beale and Mala,
San Francisco.
For sale, Mahogany, Spanish Cedar, and other Fancy
Goods. 20v12-3m

HUCKS & LAMBERT,
SOLE MANUFACTURERS OF THE CELEBRATED
H. & L. A
AXLE GREASE,
Natomia Street and North Beach,
2v12-3m SAN FRANCISCO.

PACIFIC POTTERY!
STONEWARE AND EARTHENWARE OF ALL DESCRIPTIONS,
such as Butter Pots, Pickle Jars, Churns, Water
Jugs, Beans, Flower Pots, etc., etc., from the manufac-
tury of N. CLARK, Esq., Sacramento—constantly on hand
and for sale in quantities to suit, by
20v12-3m No. 42 Clay street, between Drumm and East.

FIRE, HYDRAULIC & SUCTION HOSE,
And Leather Belting,
M. M. COOK & SON,
81 Battery Street, San Francisco.

Are now manufacturing as above, Fire, Hydraulic and
Suction Hose, and Leather Belting, of any dimension and
in any quantity which may be desired. Fire Hose and
Belting constantly on hand or manufactured to order. Also
Saddles and Horse Collars.
The subscribers would respectfully ask purchasers to call
and examine their stock—also testimonials of the efficiency
of their work from such as have used their hose both for fire
and mining purposes. A diploma was awarded to us last
year, by the Mechanics' Institute, of this city, and a silver
medal this year. 12v11-1y

J. F. & H. H. SCHAFER,
MANUFACTURERS OF AND DEALERS IN
Bedding and Furniture,
OF EVERY DESCRIPTION,
Blankets, Comforters, Sheets, Etc.,
504 and 506 Sansome street, near Clay,
San Francisco.

This establishment is now generally known to be the
CHEAPEST PLACE in the city for good Bedding. 2v12-3m

GEORGE E. BROWN,
(Late Assistant Examiner in the U. S. Patent Office.)
HAVING RESIGNED THAT POSITION AFTER A TE-
NURE of office of eighteen months, offers his services to
INVENTORS AND THEIR ASSIGNEES,

—AS A—
Patent Solicitor,
He will make Preliminary Examinations in the Patent
Office, with a view to ascertain the Patentability of any
invention that may be submitted to him for that purpose;
will prepare the necessary papers for those who wish to
make Applications for

Patents for their Inventions,
—OR FOR—
EXTENSIONS OR REISSUES OF PATENTS
Already granted; will act as an Attorney in presenting Ap-
plications at the Patent Office, and in managing them to a
final issue; will draw up Assignments; will examine into
the condition of Rejected Applications when desired to do
so, and undertake the prosecution of such as may be consid-
ered patentable, and do whatever else is usually done by
Patent Solicitors
Address, P. O. Box 257, Washington, D. C. 7v12-3m

COPPERAS! COPPERAS!
200 BARRELS COPPERAS—SULPHATE OF IRON.
For sale, in lots to suit, by
BENJAMIN BRADY,
103 California street,
2v12 Southwest corner of Davis, up stairs.

NAPA CITY, May 9th—Messrs. Dewey & Co. Patent
Agents, San Francisco: Yours of May 7th is at hand. I
am pleased to hear of the receipt of our patent papers from
the U. S. Patent Office, Washington, D. C. You have my
fullest thanks for your energetic movements concerning
the same. Respectfully, yours, W. W. LEVERING.

Mining and Scientific Press.

W. B. EWER,..... SENIOR EDITOR.

C. W. M. SMITH,..... W. B. EWER,..... A. T. DEWEY.
DEWEY & CO., Publishers.

Office—No. 505 Clay street, corner of Sansome, 2d floor.

Terms of Subscription:

One copy, per annum, in advance,.....\$5 00
One copy, six months, in advance,..... 3 00
For sale by Carriers and Newsdealers.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Mr. A. C. Knox, is our fully authorized Traveling Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.
SAN FRANCISCO, Jan 11th, 1866.

Mr. I. N. Hudson, is authorized to solicit subscriptions, advertising, etc., for the MINING AND SCIENTIFIC PRESS, in San Francisco, and to receipt for the same.

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most economical mining advertising medium in this city. Our terms are less than one half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

It is impossible for editors to know all the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

San Francisco:

Saturday Morning, July 28, 1866.

MR. CONNESS' NEW MINING BILL.

The Bill which Mr. Conness introduced into the Senate as a substitute for that of Mr. Sherman, and which we published in our issue of June 30th, as presented, has been received as amended previous to its passage in the Senate.

The amended bill grants a privilege to any miner or mining company in undisputed possession of a quartz claim, according to the local laws, and having expended in labor and improvements \$1,000, to obtain a patent for the same on application to the Federal Land Register, and the payment of \$5 per acre. No one person can obtain a patent for more than one claim on any given lode, and no association of individuals can take more than 3,000 feet. In case of adverse claims the final decision of a court of competent jurisdiction, as to the right of possession, will be recognized as a determination of the title.

No obligation and no expense is imposed upon any miner. He can either avail himself of the privileges of the bill; or he can continue to hold possession under the local laws as now. He cannot secure his title to the government except through the local laws, and through the additional requirements of the Federal law. The last section of the bill gives to the State and Territorial legislatures the power to provide rules for working the mines, and is designed to enable the miners of any State or Territory, if they are so disposed, to secure the passage of a uniform code of laws.

The bill will go to the House in its present shape. It appears to be receiving the support of the Pacific delegation generally, and it is thought in Washington that it will pass the House as it stands.

Was Sodium Known to the Ancients?

The recent discussion between the friends of Professors Wurtz, of New York, and Crookes of London, as to which of those two gentlemen are entitled to the credit of having first discovered the utility of sodium in the presence of quicksilver, as an aid in the amalgamation of gold, has revived what appears to be a fact, that neither the recent discovery of sodium itself, nor its use as an agent in aiding the amalgamation of gold with mercury are modern discoveries at all; but that both that metal and its use in mining were well known to the ancients. This fact, if it is a fact, deprives not only Sir Humphrey Davy of the credit of being the original discoverer of sodium, but also both Mr. Wurtz and Mr. Crookes of its application to gold saving.

It is now stated that previous to 1853, and years before either of the above named gentleman thought of doing so, Mr. John Calvert, an English mining engineer, experimented with sodium as an amalgamating agent for saving gold; and that he was induced to do so from having learned of its value for that purpose, from an old work entitled *Ars Omnia*, originally written in Latin, but subsequently translated into English, and which, though somewhat rare, is still within the reach of every English student. And furthermore, that he (Mr. Calvert) exhibited and explained the same at one of his *conversations*, held at his house in London, in 1853; and that the fact was alluded to in the *London Mining Journal* of July 23d of that year.

The same article in the *Journal* also alluded to certain ancient manuscripts, exhibited by Mr. Calvert at the above mentioned *conversation*, which, if genuine, are certainly very remarkable and important as antiquarian curiosities, and leading to the inference that the ancients were, at least in one respect, quite as far advanced in the science of chemistry as we of the present day. The exhibition of the manuscripts was alluded to by the *Journal* as follows:

"In the collection is an old Arabian manuscript, proving that the ancients were quite masters of the best process for dechloridizing salt, and that they not only knew of the metal of salt (sodium), but its combination with mercury, and the affinity of that amalgam for gold.

There is also a manuscript by Friar Roger Bacon upon the metal of salt, the fire of salt, etc. Other manuscripts of no doubt a cotemporary date, upon the art of salt, the magic of salt, the fire of salt, the metal of salt, etc. These old Latin treatises have less of the clouded mystical humbug of such writers as Arnoldus, etc., and clearly show that they were masters of the process of the decomposition of salt and its metal (sodium), and perhaps magnesium. In the same case is a curious Spanish manuscript, of a more modern date, entitled the "Secrets of Amalgamation," by Alonzo Barba. This elaborately describes the various methods of amalgamation, and speaks of the great advantages to be gained by the admixture of certain metal with the mercury when the ores are foul with unclean matter."

In the *London Mining Journal* of May 19th, of the present year, Mr. Calvert has published a communication, drawn out by the discussion between the friends of Messrs. Wurtz and Crookes, and republished in the *London Chemical News* (edited by Mr. Crookes), of May 25th last, and prefaced by the *News* as follows:

The following remarkable statements have been made by Mr. John Calvert, C. E., in the *Mining Journal* for May 19. Are any of our readers aware of the existence of such wonderful manuscripts? To separate sodium direct from its chloride requires more knowledge of chemistry than we possess at the present day. But of this the author of these quotations was probably not aware: "Before proceeding to describe the old woven onyx (asbestos) documents discovered by me in my voyage to New Guinea and Borneo, I will notice a few passages from the grand manuscript work of Roger Bacon (Bacon), *Ars Omnia*, in which he and his pupils seem to have amassed some considerable quantity of matter, and in translating the Arabic works of Lehri (chemical) and the Persian Eos (or *Eos*), a work describing the laws of things existing in air, also in water, and also in the earth, we are enabled to snatch that a few stray historical facts worthy of notice, which appear to suggest the origin of the science of chemistry: And there came from the

land of Jap, a long way over the big water, a man called Syni, whose skill in the art of metals and rare things was so great, that he made metals that no man knew from rock and earth, which lay in great abundance in many places; but this man Syni finding how great the admiration for gold was in all the land, forthwith set to work to make that which was prized so greatly by all men; and after many labors and the most subtle combination of uncommon matters, he took from his earthy medley real gold, which he declared to be the work of his own will, and that he transmuted the common metals into the great; but all men saw the small piece to the vast labor, and held him low in estimation until at last they sought to kill him, as one of weak magic and power; but Syni, judging their intention, fled that place, and going up into the land of the great king, he made new fire vases and stoves, and brought forth wonders of extreme variety; and, having gathered together many slaves, he caused to be hewn from the mountain his effigy, 400 (?) high, which, when all men saw, they came from far lands, and cut from their ornaments many pieces of gold to lay at his feet. The *Ars Omnia* is a vellum manuscript, subdivided into one hundred and thirty books, and is neatly written in double columns, by seven or eight different scribes, and, with the exception of a few extracts, all in pure Latin. The first forty-three books are upon the history of the earth, in which the *Eos* is frequently quoted; the next seven are made up from translations of the works of Hermes Trismegistus and Arcturius; then a book on the great Persian King Kalid, a great chemist, and three books of translations of his works; then the sixteen books on Geber, the Arabian king and chemist, and then follows a book on the 'Metal of Salt,' in which he describes how the burning matter of the salt has greater affinity for other substances still more foreign, with which it will combine, leaving the metal of salt pure. Also, at another page, he says that 'the transmutation of salt is effected by much craft and cunning, leaving a good metal the result, which is like no other metal, but the art is not known to common men.' And in the next book, entitled the 'Magic of Salt,' he says: 'It is well that the vulgar understand not the good and great art of (decomposing) the destruction of salt, as, if it were known to all, riches would be no longer held rare or even respected, as with this metal much gold can be obtained, and such great virtue doth it contain, that one piece of such size that will cover the top of the small finger will work wondrous magic throughout a great mass of such worthless stuff that no man would buy for the smallest coin; yet, when this and other metals well known to all men, shall lovingly and speedily unite in one common mass, then the adored of all metals becomes life, and is born unto man, and true and real gold may be taken from those common metals without loss to them in weight or virtue, so that by great craft, cunning, and magic, not enjoyed by common men, good gold, never again to be lost, is transmuted from the vilest of dross; and so men may enjoy riches without prying into other money oaks, or borrowing from those who have little to lend.' The next five books are upon digging into the earth for the calx of metal, and the remainder upon the art of extracting and purifying metals and earths. I have chiefly selected these passages to prove that the alchemists, in spite of all their humbug and mistaken notions, often cheated themselves; and when they fancied they were making or transmuting gold, they were simply extracting it from ores or metals which absolutely contained it."

AMERICAN INVENTIONS IN EUROPE.—It has been estimated that one-fourth of all the patents now being secured in Europe are taken by Americans. When it is considered that this is in the face of the enormous charges made for foreign patents, the inducement must be very great. Many American patents have proved very successful, and more money has been made from them than from the inventions of Europeans. This is partly due to the practical utility of the inventions themselves, and partly to the energy of the party engaged in its introduction.

AGENT.—Capt. V. Cushing, whose card appears in to-day's issue, offers his faithful services to parties in the interior who wish a reliable agent for the purchase of machinery, etc., in this city. We take pleasure in recommending him as a worthy and well-known citizen.

APPOINTMENT.—Charles H. Hitchcock, son of the late President Hitchcock of Amherst, has accepted an appointment as Professor of Geology and Mining in Lafayette College, at Easton, Pa., and has gone to Europe to spend some time among the mines of Austria before entering upon the duties of his position.

THE WORLD'S FAIR AT PARIS.

It will be recollected that the Chamber of Commerce of this city appointed a Committee some time since, to take the necessary measures to secure a creditable representation at the World's Fair at Paris, in 1867, of the agricultural and mineral products and manufactures of California. That committee met on Tuesday last, at the office of the Union Insurance Company, on California street. After some deliberation, with Mr. Chas. W. Brooks in the Chair, it was resolved to call in to the aid of the Committee representatives of other interests, to act in concert with our commercial representatives in the matter.

The Committee was accordingly reorganized as follows: W. B. Ewer, State Commissioner to the World's Fair, Chairman; Albert S. Evans, Secretary; H. P. Coon (Mayor of the city), F. B. Pigne-Dupuytren, Alexander Weill, Chas. W. Brooks, Gustave Touchard, H. J. Booth, Jacob Deeth, and Joseph McGillen. The above named gentlemen will act as a State Central Committee, to co-operate with the National Committee, at New York, and any agents the General Government may appoint in securing a proper representation of this State at the Paris Exhibition.

The Committee met on Thursday afternoon last, and went into a lengthy discussion with regard to the steps which should be taken to carry out the object in view. The Chairman called the attention of the Committee to the necessity for immediate action. There was no time to be lost; the circular issued for the Government agency in New York, states that all articles intended for exhibition should leave that city by December, at the very latest.

Mr. Deeth suggested that the representation should be sufficiently broad to include our agricultural products, as well as manufactures and minerals, to the end that the fertility of our soil and the excellence of its products might be better understood abroad.

It appeared from remarks from Mr. Weill and Dr. Pigne-Dupuytren, that there was some misunderstanding in New York as to the details of the arrangements for the exhibition, so far as this country was concerned. Applications had been made by letter, by telegraph and by persons through parties in New York, to learn what space could be allotted to this State, either in the aggregate, or for special departments at the exhibition. No information on that point had yet been obtained, and the Committee was comparatively in doubt as to what arrangements should be made.

It was also uncertain whether it would be requisite to ship articles intended for the exhibition first to New York for examination there, or whether they could be sent direct to Paris.

Mr. Touchard suggested that it was a roundabout way of doing business to ship articles from California to New York city, there to be unpacked, overhauled and re-arranged. Besides the unnecessary trouble and expense, there was danger of loss, of misplacement of labels, injury from handling, etc. The direct shipment, if possible, would be much the best, and the plan had other advantages, as had been suggested, deserving the attention of the Committee. The re-shipment of valuable minerals, especially, would not be advisable. They could hardly fail of being seriously injured and disarranged by passing through unpracticed hands.

To send to New York and get an answer in relation to these matters, by mail, would require fifty days; it was, therefore, suggested that a committee be appointed to communicate with the proper parties in New York, with instructions to learn the most necessary points of information by telegraph; the less essential to come by mail. Messrs. Weill, Brooks, Dupuytren, and Mayor Coon, were appointed to that Committee; to which was also added the Chairman.

On motion of Mr. Touchard, Messrs. Dupuytren and Deeth were appointed a Committee to further, as far as possible, the collection of mineral specimens for the exhibition. The Chairman stated that the State Agricultural Society were making some arrangements

for collecting samples of our agricultural products for the exhibition, and suggested that this Convention put itself in communication with the State Agricultural Society, with the view of co-operating with that body in furthering the work in view. On motion of Mr. Weill, the Chairman and Secretary were directed to carry out this suggestion.

Mr. Evans suggested that it would greatly facilitate matters, if persons having articles which they desire to place on exhibition, would communicate that fact at once to this Chairman, Mr. Ewer, or to Dr. Pigne-Dupuytren; so that when answers have been obtained from New York no time need be lost in making up the list and shipping the articles, in accordance with the instructions which may be sent from headquarters. It was furthermore suggested that public notice, inviting such action, should be given by all papers throughout this State friendly to the object in view. The Committee adjourned to meet at the call of the Chairman.

NEW PATENTS.

Following is a list of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, together with other issues which we deem of local interest to readers on this side of the Continent. Most of these claims have been secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

GUN-LOCK.—Wm. Rudolph and A. Braun, San Francisco, Cal.: We claim as our invention and improvement connecting the trigger to the sear by means of the hinged arm, g, substantially as described. And in combination with this trigger and hinged arm we claim the spring, i, substantially as described.

METHOD OF BURNING GAS.—John C. McNally, assignor to himself and Thomas Les, San Francisco, Cal.: I claim the burning of jets of inflammable gas in combination with clinkers, substantially as described.

PHOTOMETER.—S. G. Elliott, San Francisco, Cal.: I claim the combination of the tube, A, with the sliding, graduating tabs, B, reflector, F, and rod, E, when said tubes, reflector, and rod are constructed in this manner and for the purpose as substantially described.

METHOD OF PROTECTING PILES.—William J. L. Moulton, San Francisco, Cal.: I claim the mode of protecting piles, by means of metallic covering and cement filling, as set forth and described.

OTHER PATENTS OF GENERAL INTEREST RECENTLY ISSUED.

INSTRUMENT FOR IMITATING THE SKIN.—Frederick Klee assignor to Louis Klee, Williamsburg, N. Y.: I claim the arrangement of the screw, f, piston, d, spring, a, nut, g, and handle, c, applied relatively to the cylinder, A, combined and operating in this manner and for the purpose herein specified. 2d, The diaphragm, h, in combination with the cylinder, A, and pricks, b, constructed and operating substantially as and for the purpose set forth.

REDUCING METALLIC OXIDES.—Jacob Reese, Pittsburg, Pa.: I claim, 1st, Deoxidizing metallic oxides while in a molten or liquid condition, by means of hydrogen gas or a vapor of carbon or of hydrocarbon, or a mixture of such vapor or gas so that these oxides or ores may be reduced to a metallic condition without the use of additional fuel, substantially in the manner hereinbefore described. 2d, The use of liquid petroleum or other liquid hydrocarbon in the manufacture of iron or steel and other metals, substantially in the manner and for the purposes hereinbefore described. 3d, The use of hydrogen gas for the purpose of deoxidizing metallic oxides, substantially in the manner hereinbefore described. 4th, Making liquid wrought or malleable iron from the ore by subjecting the ore while in a melted condition to the action of hydrogen gas or hydro-carbureted vapor, or a vapor of carbon, or a liquid hydrocarbon, substantially as hereinbefore described. 5th, Making cast-steel by deoxidizing iron ore while in a molten condition, in the manner hereinbefore described, and subjecting the pure iron thus produced to a vapor of carbon or hydrocarbon, or adding thereto a liquid carbureted or hydrocarbon, until the requisite amount of carbon is added substantially as hereinbefore described. 6th, Making cast iron by deoxidizing iron ore in a melted condition in the manner described, and supplying the requisite amount of carbon in a gaseous or liquid form, substantially as hereinbefore set forth. 7th, Refining iron and steel by means of a carbon in a gaseous or liquid form, to which, after the metal has been deoxidized thereby, a sufficient amount of air, water, or steam is added to support the combustion of the carbon thus added as fuel to the melted metal. 8th, Making a belly in the lower side of the deoxidizing

chamber or reducer so as to hold the charge of melted ore away from the tuyere holes in the bottom of the reducer until the reducer is raised to admit the deoxidizing vapor or liquid, substantially as hereinbefore described. 9th, The use of a valve on one of the trunnions of the reducer, constructed substantially as hereinbefore described, so as to shut off the deoxidizing vapor or liquid from entering the reducer, when in position to receive its charge, and open the communication when the reducer is restored to its position for working.

MANUFACTURE OF BRICKS.—Frank Jones, Boston, Mass.: I claim, 1st, The process substantially as above described of applying to bricks a preparation of mastic or cement. 2d, The apparatus constructed and operating substantially as above described for applying mastic to bricks separately before being laid. 3d, As an improved article of manufacture, I claim a mastic-covered brick prepared substantially as above described.

LIGHTING GAS BY ELECTRICITY.—Samuel Gardiner, Jr., New York city: I claim, 1st, The combination with a gas-burner of an electrical conducting cord and tassel, D, D', connected with the poles of a battery, substantially as above described. 2d, The combination with the above, of the stiff wire, G, igniting-finger, J, lever, L, and spring, M, substantially as described. 3d, In combination with the electrical lighting devices herein described, I claim the non-conducting or insulating stud, R, employed in the manner described.

TURNING GAS-COCKS BY ELECTRO-MAGNETISM.—Samuel Gardiner, Jr., New York City: I claim, 1st, Turning a gas-cock by means of a sliding-rod, E, and click, G, acting directly upon the toothed-wheel, H, on the axis of said gas-cock, and employed in combination with an armature, B, and magnet, A, A, substantially as described. 2d, The combination with this armature, B, of the guides, C, C, and springs, K, substantially as and for the objects specified. 3d, The stop or stud, s, attached to the sliding-rod, E, and employed to limit the motion of the wheel, H, as set forth. 4th, The combination with the wheel, H and E, and click, G, of the retaining spring, J, applied and operating in the manner and for the purpose substantially as described. 5th, In combination with the apparatus herein described, I claim the helical spring, D, adjustable collar, M, and thumb-screw, N, arranged as described and employed for the purposes specified.

PATENTS can be obtained for citizens on this Coast, through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. In one-half the time it takes to operate through Eastern agents. From our familiarity with the subject of most California inventions, and the benefit arising from personal explanations, we are prepared to present claims with greater accuracy than could reasonably be expected of distant agents. DEWEY & CO., Patent Agents, 505 Clay street, San Francisco.

FIRE ANNIHILATOR.—A new plan for extinguishing fires has been invented in New York, which consists in a series of iron pipes, perforated with holes, which can be placed beneath the beams of every story in a building, and, when so placed, the water can be ejected through them by means of a pipe leading to the engines in the street, and each story receives a continuous shower bath of water. The advantages of this are that it keeps the fire under control and saves the necessity of opening the building. It also preserves the floors and renders it safe for the firemen to enter when the fire is well under way. Its simplicity and cheapness are not the least of its excellencies.—Flag.

The ewms annihilator was invented by a lawyer of this city, some six months ago. The inventor made application personally for a patent; but his papers were lately returned to him on account of some informality in their preparation. Had he employed a suitable attorney to manage his case, in all probability it would have been allowed ere this, and the conversion of his rights by some New Yorker would have been avoided. When will inventors learn a lesson?

A VEIN OF TRIPOLI, twenty feet in thickness, fifty rods wide, and a mile in length, has been discovered near the town of Stillwater, Minn. It is said to be free from acids, mica, or calcareous earths, and equal to the Mount Eagle tripoli, so celebrated in this country and Europe. Nothing has ever yet been discovered equal to the pure tripoli for cleansing and burnishing all metallic and glass surfaces. Tripoli is composed of the exuviae of infusoria and is entirely an animal production, although found in the earth.

TO CORRESPONDENTS.—We are in receipt of a communication from "M." of Marysville, which will receive attention next week; also a letter from "Washoe," dated Rocky Bar, Alturas County, Idaho Territory.

WINDOW SASH HANGING IMPROVEMENT.—Mr. John Henley, at 551 Mission street, an old Californian and resident of this city, has taken action to procure letters patent through our agency for a new method of hanging window sash. By his plan weights are entirely dispensed with, two cords and two pulleys being all that is required. A pulley is placed at each of the top corners of the window frame. One end of the cord is fastened to the upper sash, passed over the pulley and attached to the lower sash, whereby the two sashes are made to balance each other as perfectly as may be required. Raising one sash lowers the other. By contracting the lower sash a few inches the longest, an open space can be obtained at the top of the window by reversing the sashes. The inventor claims that by his plan the cost of hanging a window will amount to about fifty cents, against \$2.50 by the old style. If true, this will create a revolution in this branch of trade. This window casings will certainly be the strongest by this new, simple and cheap method.

THE STATE AGRICULTURAL SOCIETY will hold its annual Fair at Sacramento, commencing on the 10th of September next, and continuing one week. The Society has appropriated \$10,000 for premiums, and the Central Pacific, Sacramento Valley, and California Central Railroads, and California Steam Navigation Company, will pass all freight intended for exhibition at the Fair free, returning on the return trip the freight paid on this trip to Sacramento, upon a certificate that this articles have been so exhibited; and the same companies will pass all members of the Society, on the return trip from the Fair, free.

AUCTION HOUSE.—Messrs. Olney & Co. have opened a General Auction and Commission House, No. 418 Montgomery street—a very central and convenient location. Mining and other Corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Besides every kind of auction business, this firm will pay special attention to the purchase and sale of real estate in Oakland.

TOWNE & BACON, Print—Stock Certificates, Assessment Receipt Books, Transfer Journals, Circulars, Hand Bills, Cards, Billheads, And every kind of Job Work that may be desired.

A NEW ARTICLE OF TACS FOR GROCERS' USE. 1612 536 Clay street, opposite Leidesdorff.

OIL! OIL!! OIL!!!

THE CALIFORNIA
Aerated or Unfermented
BREAD COMPANY.
Bakery on Folsom Street,
Between Tenth and Eleventh.....SAN FRANCISCO

MESSRS. TACART, BULKLEY & DUFF, HAVING ASSOCIATED themselves in partnership, are happy in announcing to the public that they are now prepared, and would respectfully solicit, all orders for his truly wholesome and cleanly Bread. We have a sufficient number of delivery wagons at our bakery to guarantee to all who may favor us with their patronage a prompt delivery of fresh bread daily, Sundays excepted. Through the kindness of the gentlemen of the following named firms, we are privileged to keep an order box for the entry of all orders for the bakery so that they may reach our earliest attention: Order box at C. J. Hawley & Co.'s Grocery, corner Second and Jessie streets; Rowland & Walker, 647 Clay street; Plum's Carpet Store, Montgomery street, opposite Leidesdorff; O. W. Clark, Paper Hanging, corner Sansome and Clay streets. Orders handed to any of the above-named firms. We expect soon to be prepared to supply Pastry, likewise the Boston Brown Bread, and Beans of the first quality. Due notice will be given. The present Company is entirely independent of the former California Unfermented Bread Company, neither of them having been in any way connected with that company. We would cordially invite the public to make a visit to our new bakery. 4v12-2m S. R. BULKLEY, Business Partner.

ESTABLISHED [MAY, 1860.]
VOLUME THIRTEEN
—OF THE—
Mining and Scientific Press,
COMMENCING JULY, 1866.
DEWEY & CO., Publishers.

Issued every SATURDAY, at our Book and Job Printing Office, 505 Clay street, corner of Sansome, San Francisco.
Terms in Advance.—One year, \$5; six months, \$3; single copies, 15 cents; Monthly Series, \$5 50 per year, or 65 cents per number. Back Volumes from January, 1861, \$3 per volume; bound, \$5 per volume.

THE MINING AND SCIENTIFIC PRESS is now thoroughly established, and enjoys one of the largest and most permanent subscription lists of any weekly journal on this coast. The individual character and reputation of its constant patrons throughout the entire coast is one of the best recommendations of its merits and value as a medium of intelligent progress and prosperity.

DEWEY & CO., Proprietors,
Mining and Scientific Press Patent Agency, Newspaper Book and Job Printing Office, 505 Clay street, San Francisco.

Pacific Mail Steamship Co's
THROUGH LINE TO NEW YORK,
Carrying the United States Mail.

LEAVE FOLSOM STREET WHARF, AT 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPENWALL for NEW YORK.
On the 10th, 18th and 30th of each month that has 31 days.
On the 10th, 18th and 30th of each month that has 30 days.
When the 10th, 18th and 30th fall on Sunday, they will leave on Saturday preceding; when the 18th falls on Sunday, they will leave on Monday following.
Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.
Departures of 18th or 19th connect with French Transatlantic Co.'s steamer for St. Nazaire, and English steamer for Southampton.
Departure of 10th connects with English steamer for Southampton, and P. R. Co.'s steamer for Central America.
Departure of the 30th connects with English steamer for Liverpool, and the port of the new mines.
The following Steamships will be dispatched on dates as given below:
July 30th—CONSTITUTION.....Capt. E. S. Farnsworth, Connecting with ARIZONA, Capt. Maury.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult. An experienced Surgeon on board. Medicine and attendance free.
These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.
For Merchandise and Freight apply to Messrs. WELLS, FARGO & CO.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

SUBSCRIBERS who do not receive the MINING AND SCIENTIFIC PRESS in due time, are requested to inform the publishers.

THE TENACITY OF LIFE IN EELS.—It is well known that eels, after being beheaded and skinned, and having their entrails taken out, will often wriggle and move considerably. What is the philosophy of this; are they alive, or is it the involuntary action of the nerves and muscles?

The lower orders of animals, such as the snake, the eel, and the turtle, have but little brain, and their sensations, and the governing forces of their bodies, are distributed in ganglia or nervous knots, over a considerable extent of the system; while in man the motive force is located in the brain. When a man has his head severed or disconnected from the body, his dying struggles are comparatively short. It is said that a turtle will live a day or two with the head off.

Machinists and Foundries.

PALMER, KNOX & CO.,
Golden State Iron Works,
Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF
MACHINERY,
STEAM ENGINES AND QUARTZ MILLS
DUNBAR'S IMPROVED
Self-Adjusting Piston Packing,
Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S
NEW GRINDER AND AMALGAMATOR
HEPBURN & PETERSON'S
AMALGAMATOR AND SEPARATOR,
Tyler's Improved Water Wheel,
Giving the greatest power, at lower cost, than any wheel in use. There are over 1,500 running, giving universal satisfaction.

KNOX'S AMALGAMATORS,
WITH PALMER'S PATENT STEAM CHEST,
Superior for working either Gold or Silver Ores.
Genuine White Iron Stamp Shoes and Dies
Having been engaged for the past eight years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver.

DEVOL, DINSMORE & CO

JOHN LOCHHEAD'S
Steam Engine Works,
Beale Street, near Mission, San Francisco.

STEAM ENGINES OF EVERY DESCRIPTION BUILT
to order—Marine, Stationary, or Locomotive.
HOISTING AND PUMPING ENGINES,
PORTABLE ENGINES, OF ALL SIZES,
DONKEY PUMPS, Etc., Etc., Etc.
The attention of the parties engaged in shipping or inland navigation is called to the

Superior Workmanship
of Mr. LOCHHEAD, who has been in the business in San Francisco for the last fourteen years, and enjoys the reputation of having built ONE HUNDRED AND SEVENTEEN STEAM ENGINES.
Screw Propellers of all kinds, and Steam Boat Machinery generally, made to order, and warranted to give perfect satisfaction in every particular.

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic Hays, Rags, Screw and Drop Presses, Coining Machinery, The Drivers, Bark and Malt Mills, and all kinds of Castings.
ENGINES.—Marine Engines, Oscillating and Beam; Stern and Side Wheel Bots, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.
BOILERS.—Locomotive, F.e.e. Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.
PUMPS.—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's Improved Tractory Curve Pan, Zenas Wheeler's Improved flat bottom pan, Beldin's pan, Yeatch's tubs, Prater's concentrators, Waklee's pans, Beers' pan, Oerman Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

OIL BORING TOOLS AND MACHINERY.—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.
Russia Iron Screens, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

H. J. BOOTH. GEO. W. PRESCOTT. IRVING M. SCOTT.
24v12 **H. J. BOOTH & CO.**

Vulcan Iron Works Company
(ESTABLISHED 1850.)
First, Natoma and Fremont Streets.

IRON FOUNDERS,
Steam Engine and Locomotive
BUILDERS,
Boiler Makers, and Workers in Sheet Iron, Brass and Copper.

These Works have lately been increased by the addition of new shops on Fremont Street, doubling the capacity of the original establishment. Their facilities for turning out machinery promptly and efficiently, are now unequalled in the State. Their Boiler Works have also been enlarged correspondingly.

The Company are prepared to execute orders for all classes of Machinery and Boiler Work, such as
Mining, Steamship, and Steamboat Machinery,

Railroad Machinery, Flouring Mills, Locomotives, Sugar Mills, Car Trucks, Saw Mills, Car Wheels, Hoisting and Irons; and
Manufacturing Machinery of Every Kind.

Sole Manufacturers of
HEPBURN & PETERSON'S REDUCING PAN AND AMALGAMATOR
BEATTY'S AMALGAMATOR
HEBSE & MOORE'S IMPROVED HOWELL QUARTZ CRUSHER
BAUX & GULD'S AMALGAMATOR AND SEPARATOR
SAUCHERY'S QUARTZ GRINDER AND WATER WHEEL
JONAL'S IMPROVED WATER WHEEL
LEFFEL'S AMERICAN DOUBLE TURBINE WATER WHEELS.
STEVEN'S PISTON PACKING RINGS.

They have also a large assortment of Patterns for Pumping and Hoisting Machinery, Gearing, Pulleys, Water Mill Irons, Hydraulic and Screw Presses, Retorts, Furnaces, Gate Bars, House Fronts, Ornamental Fence Posts and Fencing, Stove Ranges, etc., etc.

Quartz Stampers, Shoes and Dies, of the best Hard Iron, Quartz Screens of Russia
Iron Punched to Order.

Pioneer Iron Works.
KITTREDGE & LEAVITT,
MANUFACTURERS OF

FIRE-PROOF DOORS AND SHUTTERS
Steel Lined Bank Vaults and Safes, PRISON CELLS, BALCONIES, AWNINGS, Grating and Iron Fences; Stairs, Etc.

ALSO, AGENTS FOR
BUSSEY'S NEWLY PATENT COMBINATION BURGLAR-PROOF LOCK,
No KEY, or visible signs of OPENING, Corner of Fremont and Market streets, San Francisco.

Constantly on hand a large assortment of Second-Hand Fire-Proof Doors and Shutters.

LEWIS COFFEY,
LEWIS COFFEY & RISDON,
Steam Boiler & Sheet Iron Works.

THE only exclusively Boiler Making establishment on the Pacific Coast owned and conducted by Practical Boiler Makers. All orders for New Work and the repairing of Old Work, executed as ordered, and warranted as to quality.

Old Stand, corner of Tush and Market streets, opposite Oriental Hotel, San Francisco.

J. F. FLYNN. HENRY FRANK.

FLYNN & FRANCE,
EMPIRE FOUNDRY.

221 Mission Street, below Beale, San Francisco. PRACTICAL IRON FOUNDERS, having located facilities for the manufacture of Light Fancy Castings, particular attention will be given to this department. We manufacture Ship Castings, Stake Irons, and all other kinds of Heavy and Light Castings, with dispatch. The patronage of the public is respectfully solicited.

HANSCOM & CO.,
Etna Iron Works!
Southeast corner Fremont and Tehama streets, SAN FRANCISCO.

Practical Machinists and Iron Founders,
MANUFACTURE
STEAM ENGINES,
QUARTZ MILL MACHINERY OF ALL KINDS,
SAW MILLS, FLOUR MILLS,
Dunbar's Improved Self-Adjusting
PISTON PACKING,

Now so extensively used in the East and in this State. Requires no springs or screws; is always steam-tight; without excessive friction, and never gets slack or leaky.

HANSCOM'S CRUSHER,
The best of the kind now in use in this State or anywhere else
Wheeler & Randall's New Grinder and Amalgamator,

Which only needs examination to be appreciated.
Tyler's Improved Water Wheel,

Giving greater power, at lower cost, than any wheel in use. Send for one of our circulars, giving full tables.

All Wheels warranted to give the power as set forth, or the money will be refunded.
Sole makers for this coast of the "Pendergast White Iron Stamp Shoes and Dies."

None genuine unless obtained from us. Every one warranted.
Patented Machinery of all kinds will be furnished by us at market prices. Particular attention given to drawings and specifications of machinery, which will be made to order. The patronage of the public is respectfully solicited.

NEPTUNE IRON WORKS,
Corner of Mission and Fremont Streets, SAN FRANCISCO.

MARINE, Locomotive,
And all kinds of
HIGH PRESSURE Steam Boilers
MADE.
All Boilers guaranteed and tested by U. S. Boiler Inspector before sent out of the Shop, at Shop expense.

All kinds of Sheet Iron and Water Pipe, Coal Oil Stills, Wrought Iron Worms, etc., etc. Manufactured to Order.
Old Boilers Repaired
D. CAMERON.

JAMES MACKEN, COPPERSMITH,
No. 226 Fremont St., bet. Howard & Folsom.

All kinds of COPPER Work done to order in the best manner. Particular attention paid to Steamboat, Sugar House and Distillery work.

Repairing promptly and neatly attended to.

Economy in Advertising.—THE MINING AND SCIENTIFIC PRESS is the best and most economical mining advertising medium in this city. Our terms are less than one half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

UNION IRON WORKS,
Sacramento.

WILLIAMS, ROOT & NEILSON,
MANUFACTURERS OF
STEAM ENGINES, BOILERS,
And all kinds of Mining Machinery.
Also, Hay and Wine Presses made and repaired with neatness, durability and dispatch.
Dunbar's Patent Self-Adjusting Steam Piston Packing, for new and old cylinders, manufactured to order.
Front Street, between N and O streets, 14v11
SACRAMENTO CITY

Miners' Foundry
—AND—
MACHINE WORKS,

First St., between Howard and Folsom Streets, SAN FRANCISCO.

EVERY description of Iron and Brass Machinery, the State of California, will be furnished with dispatch at the MINERS' FOUNDRY AND MACHINE WORKS, such as
Steam Engines and Boilers, Flour, Saw and Quartz Mills, Machinery, Mining Pumps, Amalgamators, Retorts, Etc., Etc.

Particular attention will be given to the manufacture of Machinery in Sections designed for places of difficult access. Various models of Quartz Crushers, Amalgamators and Water Wheels—some in operation and on exhibition.
Parties desiring to test their ores practically, in small quantities, will be afforded ample facilities, free of cost.
All parties desiring accurate and highly finished drawings and superior Machinery, at most reasonable rates, are cordially invited to call before contracting elsewhere.

HOWLAND, ANOEL & KINO

M. GREENBERG. **W. H. MOORE.**
GREENBERG & MOORE,
Eagle Brass Foundry,
No. 43 First Street, San Francisco,
(Between Mission and Market.)

And Quartz Machinery, Printing Presses, —AND—
MACHINERY OF EVERY DESCRIPTION MADE AND REPAIRED.

Special attention paid to Repairing. 24v12-3m

DEEP DIVING.—The deepest recorded descent of any submarine diver was made in November, 1866, at Brest, in efforts to reach the sunken hull of the English ship *Columbian*. Two descents were made, each of which reached a depth of 196 feet. In the first instance one of the air-pumps burst at that point, and the diver was immediately brought to the surface. The diver came up safe and sound. Fresh pipes having been secured, the diver on a subsequent day again made the descent. Having reached the same depth as before, having remained there for the space of about eight or ten minutes, he gave the signal to be hauled up. The signal was immediately complied with, but before the necessary time had expired for the apparatus to reach the surface, the diver, inclosed in his armor, was seen afloat upon the water at a short distance from the steamer from which the experimenters were working. He was immediately taken on board in a very exhausted state. He fainted twice, but by the use of proper restoratives was rendered quite comfortable in about two hours. From the time he reached 180 feet in depth, the indicator showed a pressure of six atmospheres—ninety pounds per square inch. On being taken on board from the second trial, the armor was found to have been broken, so that the water was forcing its way in and filling up the legs of the apparatus. Aside from that accident, the experiment proved conclusively that no human being could stand a pressure of ninety pounds to the square inch for any considerable length of time. On the first attempt the submarine lamp with which he was accompanied was crushed in by the pressure of the water.

MADE MONEY ENOUGH.—Elias Howe says that he shall not apply for an extension of his sewing-machine patent, which expires this year, as he has already made a million and a half dollars on it, and thinks that is enough. Mr. Howe is much more remarkable as a man, who has got money enough, than as an inventor.

A LUCKY FIND.—The *Idaho Index* of July 11th, says that it is reported that several days after the Indians made their onslaught on the Chinamen near Summit Spring, and killed and robbed many, a traveler coming up the road noticed a part of a sack of rice. Picking it up, and emptying out the contents, he discovered a package containing nine hundred dollars in coin.

GREASY ORES IN ARIZONA.—Of nothing have our miners complained more than of greasy ores (so called). This greasiness coats the quicksilver, and prevents amalgamation, and, of course, the gold floats away. This greasiness is usually, perhaps always, caused by the presence of steatite or talc in some form. In some forms this bears the name of soap-stone. Every one knows its greasy character. Its composition is silica, magnesia and water. It often contains (especially in Colorado) a small amount of carbonic acid. Meerschmann is also a variety of talc. Thus much for the composition of the mineral substance which causes the trouble. Burning may not remove the difficulty, because this combination will not be materially changed by the action of fire. It must be some substance that will have a chemical action. Quicklime has been found in many instances to have the desired effect in destroying the oily character, and has been extensively employed, and with the best of success. In some cases other mineral substances will be found to be the cause of the greasy character, and the ores must in such cases be treated differently. Sometimes roasting the ores removes the difficulty—only practice and experience can conquer in every case. Every different ore may require a different treatment. Where the talc or minerals occur it will often be found necessary, even after roasting, to use some other means, and so with other combinations, while antimony and arsenic can only be got rid of by roasting.—*Arizona Miner*.

THE EOLIAN HARP is a very simple instrument, easily constructed, and produces very pleasant music. To make one, take two strands of strong sewing silk, well waxed, a single and double twist, fastened to four pegs, one inch high, on an inch board as long as the width of your window. At one end the pins should have a thumbtack similar to a violin pin, to enable you to draw it taut. Place it in a window, the sash resting on the pins, and when the wind blows you have such sounds as the angels love. One string will produce several notes, changing as the wind is gentle or forcible.

THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequalled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully Solicited.

Rheumatism!!
READ IT! READ IT!!

SACRAMENTO, April 16th, 1866.
H. BOWMAN—DEAR SIR: THIS IS THE FIRST WRIT. I have done in two years, and it affords me great pleasure to be able to use my pen in the service of those who are suffering, as I have suffered, by stating the following facts:
I have for two years and upwards been afflicted with CHRONIC RHEUMATISM, and until a few weeks ago I have never found anything that afforded me any relief. For three months of the time I was unable to feed myself, and for the last five months my arms have been so bent that I have not been able to dress myself. I was five months at the Warm Springs, at San Luis Obispo, and three months at a Hydropathic Institute in Stockton, and I have been under the care of six different physicians, in the vain hope of relief. About four weeks ago I was induced by a person who had been cured by it to try a bottle of RICHARD'S REMEDY FOR RHEUMATISM, and in less than twelve hours I experienced great relief. In a few days I was enabled to straighten out my arms, and I have been getting better and gaining in strength and flesh ever since. I have now the complete use of all my limbs, and, for the first time in two years, I am out of pain. I do feel for those who suffer as I have suffered, and if they will take my advice, they will lose no time in giving the RICHARD'S REMEDY a trial.
Yours truly,
GEORGE TAYLOR.

RICHARD'S REMEDY is for sale by
H. BOWMAN,

A Rare Chance!
A Splendid Business in Alameda County.

FOR SALE AT A GREAT BARGAIN,
400 ACRES OF LAND,

INCLUDING
Landing, Wharf, Three Capacious
Warehouses,

Capable of holding 12,000 Tons, which amount of grain was stored and shipped the past year. Connected with said business there is an extensive Lumber Yard; sales during last year, two million feet, which sales, and the entire business, can be largely increased.

The above is a rare opportunity for parties desirous of engaging in an active business that will pay a large dividend on the investment. Satisfactory reasons given for selling, and all information desired can be obtained on application by mail, or otherwise, to

G. F. SMITH,
Notary Public and Searcher of Records, Office "Beatty House," San Leandro. 23v12 1m

Capitalists, Attention!

**QUARTZ MILL & MINING PROPERTY
FOR SALE
In Nevada County.**

A NEW 8-STAMP QUARTZ MILL, 7 LEDGES AND 640 acres heavily timbered Land, near Eureka, Nevada County, are now offered for sale. The Mill is run by steam-power, and is in complete order for business. The ledges, which form the principal value of this property, are all large and well-defined, but require a further outlay of capital, in order to make them remunerative. For the lack of means to properly develop these claims, the present owners are disposed to sell the same for a reasonable price. Capitalists wishing to engage in mining will find this a splendid opportunity to purchase a property that will bear ripe scrutiny, and offers superior inducements as an investment.

For address and further information, inquire of the Publishers of the Mining and Scientific Press, 505 Clay Street, San Francisco. 22v12

THE PRESS is a large, sixteen-page paper, and is truly a valuable assistant to the mining interests of the Pacific Coast.—*Nye County News*.

Judicious Resolutions.

Several of our most substantial and judiciously managed mining corporations have passed resolutions, since the approval of the new assessment law, requiring all notice of assessments and sales to be published in the MINING AND SCIENTIFIC PRESS, the only thorough (daily or weekly) mining journal on this coast. Our efforts to concentrate all mining advertisements in one paper, for the economical convenience of shareholders and assessment payers, are meeting with decided success. Those who believe in supporting the mining cause, should bear our paper in mind, and bring up this subject at the next trustee or shareholders' meeting.

San Francisco, April 7th, 1866.

New Mining Laws of California and Nevada.

We have just issued, in cheap edition, the new laws relating to mining and corporations in California and Nevada, passed in 1865-6. Some of these laws are of the highest importance to parties interested in the matter of locating and holding claims, and prospecting mines, in these States. Copies sent by mail. Price, 25 cents.

Address, DEWEY & Co., Patent Agents.
San Francisco, May 1st, 1866.

It is filled with reliable, useful and interesting matter and to our miners who wish to understand the theoretical, as well as the practical part of their business, the MINING PRESS will be found an invaluable aid.—(Nye County News)

Professional Cards.

ENGRAVING AND ELECTROTYPING

THE PROPRIETORS OF THE MINING AND SCIENTIFIC PRESS, having now in their office one of the best draughtsmen in the United States, are prepared to furnish Wood Engravings, for illustrating all kinds of machinery, buildings, mines, trade marks, etc., in a superior and artistic manner. We shall give our customers in this line satisfactory work, and reasonable prices. Orders for stereotyping and electrotyping promptly filled.

DEWEY & Co.,
Publishers and Patent Agents.

City College Laboratories,

South-east Cor. Stockton and Geary sts.

Practical and Analytical Chemistry and Metallurgy.

THOMAS PRICE,
Professor of Chemistry,
(Formerly of the Normal College, Swansea.)

WILL GIVE PRACTICAL INSTRUCTIONS IN QUALITATIVE AND QUANTITATIVE ANALYSIS AND ASSAYING. The course qualifies students for the application of Chemistry to METALLURGY, MANUFACTURING ARTS, and MINING PURPOSES.

PHARMACEUTICAL AND TECHNICAL CHEMISTRY, such as is required by Medical and Pharmaceutical Students, will be taught to such students as may require it.

Course of General Chemistry.

Evening Lectures will be delivered every Tuesday, at half-past seven o'clock, P. M., in the Philosophical Hall of the College, without extra charge to the students in the Institution.
On and after the 14th of February, the Laboratories will be open every day, except Sundays, from 8 A. M. to 5 P. M. For further particulars, address

REV. P. V. VEEDER,

Principal of the City College.
Or at 406 California Street.

YOUNG MEN WANTED!

Pacific Business College!

751 Market street, between Third and Fourth,
SAN FRANCISCO.

AN INSTITUTION DESIGNED TO PREPARE YOUNG and middle-aged men for an active and successful business life.

BOOK-KEEPING, PENMANSHIP, COMMERCIAL LAW, COMMERCIAL ARITHMETIC, CORRESPONDENCE, MODERN LANGUAGES, ETC.,

Practically taught.

This College forms a link of the

American Chain of Commercial Colleges,

Located in the principal cities of the United States, and is the only institution on the Pacific coast conducted on actual BUSINESS PRINCIPLES.

Regular Banks and Business Offices have been introduced.

By which we are enabled to fit our Students in the BEST POSSIBLE MANNER, and at the LEAST EXPENSE of time and money, for the practical duties of the Counting House.

Students can enter at any time of the year, there being no vacations. Each student receives individual instruction, with the exception of Lectures and other general exercises.

The College Review.

Giving full particulars of the College, can be had FREE, by calling at the College, or addressing

E. P. HEALD,

3v13 President Business College, San Francisco.

SAN JOSE INSTITUTE

—AND—

Commercial College,

SAN JOSE,

Santa Clara County, California.

THE NINTH SESSION WILL COMMENCE ON THURSDAY, July 26th, 1866.

A new, practical and complete Business Course has been adopted, differing from that of any other School in the State. We call the especial attention of Business Men, or those wishing to give their sons a thorough practical Business Education, to this fact, and request them to send for a Circular before deciding what School they will attend. Ample accommodations for boarders in the Seminary. Ornamentals, Music, Ancient and Modern Languages taught.

Special arrangements have been made for boys between the ages of ten and eighteen.

For further particulars or Circular, address

FREEMAN GATES, Principal.

Or, GEO. E. HOUGHTON, Prin. Com. Dept. 1v13tr

SACRAMENTO SEMINARY.

BOARDING SCHOOL

FOR YOUNG LADIES,

Tenth Street, between F and G.
SACRAMENTO, CAL.
Session commenced January 8, 1866.

MR. AND MRS. HERMON PERRY,
7v12tr Principals.

SANTA CLARA COLLEGE, S. J.,

SANTA CLARA, CAL.

Conducted by the Fathers of the Society of Jesus.

The SIXTEENTH ANNUAL SESSION of this College will commence on

Monday, August 20th, 1866.

TERMS—Tuition in the Classical and Scientific Department; Boarding and Lodging; Washing and Mending of articles washed; School Stationery; Medical Attendance and Medicine; fuel, light, baths, etc., per session of ten months, \$350.
For further information and catalogues, apply to the President of the College, or to Rev. A. Maraschi, St. Ignace College, Market street, San Francisco.

REV. A. MARASCHI, S. J., President.

Commercial Academy for Ladies & Gentlemen.

No. 111 K STREET, SACRAMENTO, CALIFORNIA.

Established in 1863, where students can acquire a thorough business education. Double Entry Book Keeping, Practical and Ornamental Penmanship and Drawing, Latin, French, the Common and Higher English Branches, taught on reasonable terms. Students from any part of the State can procure board and lodging in private families, near the Academy, at from \$4 to \$6 per week. For terms, address, MART TAYLOR, Principal, Miss SARAH J. WEBB, Associate Principal. 2v12

By MAIL.—THE MINING AND SCIENTIFIC PRESS will be sent by mail to any part of the civilized world. In case of removal, subscribers have only to inform us of the post-office address of their old and new location, and the paper will be sent accordingly.

Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding the three month's delay requisite in transacting business through Eastern agencies.

VALUABLE MINES!

FOR SALE

IN NEVADA COUNTY.

FOUR VALUABLE QUARTZ MINES, SITUATED AT THE base of Deer Mountain, and about equi-distant from Grass Valley and Nevada City, are now offered for sale. These ledges run parallel with each other, are wide and well defined, varying from fifteen inches to four feet in width, and have been sufficiently developed to prove them to be of great prospective value. One of them is an extension of the famous Star Spangled Banner. A shaft has been sunk on the extension to a depth of thirty feet, where the ledge is fully two feet wide, and prospects quite as well as the Banner did at that depth. On account of water, further progress downward was impossible without machinery. These claims are accessible at all seasons of the year, and wood and water exist in their immediate vicinity in great abundance. Parties who would prefer putting up machinery and sinking on one or more of these claims, for an interest in them, can do so, and liberal terms will be granted by the present owners.

Persons desiring to purchase claims, or erect machinery to prospect the same, will find this a capital chance. For further information, reference may be had on application to the Editors and Publishers of the MINING AND SCIENTIFIC PRESS, 505 Clay street, San Francisco. 2v12

ANNUAL REPORT

—OF THE—

Pacific Insurance Company.

IN COMPLIANCE WITH THE ACT OF THE LEGISLATURE of the State of California, entitled "An Act concerning Corporations," passed April 22, 1861, the Pacific Insurance Company of San Francisco makes the following Annual Report:

I.—The amount of the Capital Stock of this Company is SEVEN HUNDRED AND FIFTY THOUSAND DOLLARS, and paid in GOLD.....\$750,000
II.—The amount of the Assets is ONE MILLION AND FIFTY ONE THOUSAND FOUR HUNDRED AND TWENTY DOLLARS AND THIRTY SEVEN CENTS, \$1,051,420.37

III.—The Company has NO DEBTS.
IV.—The amount of insurance effected during the year, and which remained in force December 31, 1865, was.....\$12,973,949
Marine.....484,408
This Company commenced underwriting Marine Risks, August 1, 1865.

V.—This Company insures against the following risks, viz: BUILDINGS, HOUSEHOLD FURNITURE, MERCHANDISE, RENTS, LEASEHOLDS, VESSELS IN PORT AND THEIR CARGOES, and other PERSONAL PROPERTY, AGAINST LOSS OR DAMAGE BY FIRE.

Also, on CARGOES, TREASURE, COMMISSIONS, PROFITS, and WAR RISKS, and ON ALL MARINE AND INLAND NAVIGATION RISKS, TO AND FROM ALL PORTS IN THE WORLD.

VI.—This Company will take on any FIRST-CLASS RISK not to exceed \$75,000 (the limit fixed by law), and on all large risks will require to an extent consistent with PRUDENCE in other RESPONSIBLE COMPANIES.

J. HUNT, President.

And in accordance with law and an order of the Board of Trustees, made on the seventh day of June, 1886, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, by Messrs. Jones & Bondixen, on Friday, the tenth day of August, 1886, at the hour of 2 o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

N. C. FASSETT, Secretary.
 Office, 402 Front street, San Francisco, Cal. July 21

THE MINING PRESS has entered upon its thirteenth volume. It is a valuable publication in its sphere, and its sphere is a large and important one. [Marysville Appeal.]

Eagle Quartz Mining Company--Location of Works: Amador County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the nineteenth (19th) day of July, 1886, an assessment of one (1) dollar per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at the office of the Company, No. 10 Exchange Building (713 Montgomery street), San Francisco, California. Any stock upon which said assessment shall remain unpaid on the eighteenth (18th) day of August, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the fifth day of September, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN M. BURNETT, Secretary.
 Office, No. 10 Exchange Building, San Francisco, Cal. July 14

Great Central Mining Company--Location of Works: Yuma County, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the second (2d) day of July, A. D. 1886, an assessment of one (1) dollar per share was levied upon the capital stock of said Company, payable immediately, in gold coin of the United States of America, to the Secretary, at the office of the Company, No. 302 Montgomery street, between the hours of 4 and 5 P. M. Any stock upon which said assessment shall remain unpaid on the third (3d) day of August, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on the twenty-seventh (27th) day of August, A. D. 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

O. D. SQUIRE, Secretary.
 Office, No. 302 Montgomery street, San Francisco. July 7

Nonpareil Gold Mining Company, Deer Flat, Tuolumne County, California.

Notice--There are delinquent upon the following described stock, on account of assessment levied on the ninth (9th) day of June, 1886, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
W. B. Agard	13	30	\$30 00
W. B. Agard	20	20	20 00
Thomas Foulkes	14	20	20 00
Thomas Foulkes	23	10	10 00
Thomas A. Hughes	10	10	10 00
Thomas A. Hughes	29	10	10 00
G. W. Beaver	45	10	10 00

And in accordance with law, and an order of the Board of Trustees, made on the ninth (9th) day of June, 1886, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the saleroom of Cobb & Slaton, 407 California street, San Francisco, on the thirty-first (31st) day of July, 1886, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

S. A. ELDRIDGE, Secretary.
 Office, Merchants' Exchange Building, corner Washington and Battery streets, San Francisco, Cal. July 14

Gold Hill Tunneling Gold and Silver Mining Company--Location: Gold Hill Mining District, County of Storey, State of Nevada.

Notice--The Third Annual Meeting of the stockholders of the above named Company, will be held at their office, 415 Montgomery street, San Francisco, Cal., on SATURDAY, the twenty-first (21st) day of July, 1886, at 7 1/2 o'clock P. M., for the purpose of electing Trustees to serve for the ensuing year, and such other business as may properly come before it.

R. WEGENER, Secretary.

N. B.--All stockholders who are not present are requested to file their proxies with the Secretary. July 23

Postponement.--The above meeting is hereby postponed until Tuesday, the 31st day of July, 1886, at 3 o'clock P. M. July 21

R. WEGENER, Secretary.

Lady of the Lake Gold and Silver Mining Company, San Francisco District, Mohave County, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 29th day of July, 1886, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company, payable on the twenty-first day of July, 1886, in United States gold and silver coin, to the Secretary, at his office in San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the 2d day of August, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 10th day of September, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. HOLLIS, Secretary.
 Office, No. 302 Montgomery Street, Room No. 2, third floor, San Francisco, Cal.

N. B.--By resolution of the Board of Trustees, it was ordered that a discount of three per cent. be allowed on all payments made prior to August 2d, 1886.

WM. HOLLIS, Secretary.

Leland Gold and Silver Mining Company, San Francisco District, Mohave County, Arizona Territory.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 20th day of July, 1886, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company, payable on the 21st day of July, 1886, in United States gold and silver coin, to the Secretary, at his office in San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 22d day of August, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 10th day of September, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. HOLLIS, Secretary.
 Office, No. 302 Montgomery street, Room No. 2, third floor, San Francisco, Cal.

N. B.--By resolution of the Board of Trustees, it was ordered that a discount of three per cent. be allowed on all payments made prior to August 2d, 1886.

WM. HOLLIS, Secretary.

Lady Bryan Gold and Silver Mining Company--Location of Works: Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twentieth day of July, 1886, an assessment of one (1) dollar per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at the office of the Company, 323 Montgomery street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-fifth day of August, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on the eleventh day of September, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

H. C. HOWARD, Secretary.
 Office, 323 Montgomery street, San Francisco. July 21

Scott Mining and Exploring Company--Location of Mines, etc., in Humboldt County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourteenth day of July, 1886, an assessment of fifty-five cents per share was levied upon the capital stock of said Company, payable on the twenty-first day of July, 1886, in United States gold and silver coin, to the Secretary, at 224 Front street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the eighteenth day of August, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the fifth day of September, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

V. B. POST, Secretary.
 Office, 1421 Taylor street, San Francisco, Cal. July 21

Nuestra Señora de Guadalupe Silver Mining Company, Yavapai District, Durango, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 25th day of June, 1886, an assessment of No. 24, of one dollar (\$1) per share was levied upon the assessable capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, E. J. FEIFFER, at the office No. 210 Post street, or to the Treasurer, A. HIMMELMANN, at his office, No. 637 Washington street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the 31st day of July, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the 15th day of August, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

E. J. FEIFFER, Secretary.
 Office, 210 Post street, San Francisco, Cal. July 20

Postponement.--The day for deeming stock delinquent on the above assessment is hereby postponed until Monday, the 27th day of August, 1886, and the sale thereof until Monday, the 17th day of September, 1886. By order of the Board of Trustees

THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Fram; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; a, Dies; c, Shoes, and e, Openings.

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan when properly constructed, are respectively 177, 118 and 132.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan one hundred and eighteen tons, and the Conical Pan one hundred and thirty-two tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes direct from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been harnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the
PACIFIC FOUNDRY,
171 San Francisco.

IRON!

Glasgow Iron and Metal

IMPORTING COMPANY,

Nos. 25 and 27 Fremont street, San Francisco,

Keep constantly on hand a large assortment of

LEFFEL'S

American Double Turbine.

THIS WHEEL, WHICH HAS HAD THE most unprecedented sale of any water-wheel ever made, and which has given universal satisfaction wherever used, is now for sale by KNAPP & GRANT, 310 Washington street, San Francisco, where persons desiring to use water-power can be supplied. These wheels are adapted to use from 10 to 5,000 inches of water, and from 4 feet to 500 feet fall. Let us know how much water you have either in mill-races or cubic feet per minute, what fall you have, and what power you require. Write or send for circular to
KNAPP & GRANT,
—ALSO—
San Francisco.

Leffel's Lever Jacks,

For railroads, cars, or wagons; Railroad Jacks for engines and cars; Track Jacks for leveling, with which three men, with a pair of these Jacks can level more track in a day than twelve men working in the ordinary manner; also, Track Jacks, for relieving the axle of pressure to replace the brass. These Jacks are now in general use in the Eastern States, and give entire satisfaction. Also, Wagon and Track Jacks of the most superior make and kind. For sale by
KNAPP & GRANT,
San Francisco,
12v12-3m

BAUX & GUIDO'S Separator and Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine Scientific Knowledge with Practical Experience, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgamators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIDO'S Pan, are the following: The trifling cost for attendance; its small cost; its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jefferson Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crall's Gravel Cement Works, Nevada county; Waltham's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe. Manufactured at the Vulcan Iron Works and San Francisco Foundry, San Francisco, and at Hough & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address
J. B. BAUX,
Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v5-6d7

Cotton-Filled Gum Belting,

GILLIG, MOTT & CO.,

Corner C and Taylor streets,

VIRGINIA, NEVADA.

—AND—

Nos. 148 AND 150 J STREET,

19v12 11 SACRAMENTO, CALIFORNIA.

To Ditchmen, Millmen and Others Requiring IRON PIPE.

M. R. ROSE, CORNER OF 9TH AND K STREETS, Sacramento City, has facilities unsurpassed on this coast for the manufacture of IRON PIPE of every description. He also has on hand a deep well FORCE PUMP, of his own invention and manufacture, well adapted for oil wells. His tools being portable, pipe can be manufactured on the ground. 19v12

EXCELSIOR PUMP!

THIS DOUBLE-ACTING SUCTION AND FORCE PUMP CHALLENGES COMPETITION for simplicity, durability and power, and will work at any depth. The pistons for Mining Pumps are packed with hemp. The valves are reached by simply removing the "bonnets," thereby avoiding the trouble of raising a long column of pipe. They will raise as much water as TWICE their size of single-acting Mining Pumps, and are sold at half the price. We have never heard of the valves in this Pump being out of order. For their many superior points they are fast replacing all other Force Pumps. Reference can be given where this Pump is working with eighteen others of different patterns, and is pronounced THE BEST; also, from some of the best miners in the State who have them in use. For manufacturers, farmers or domestic use, we warrant them the best and cheapest. All sizes adapted to any power or any purpose. For sale by agents throughout the State.

J. W. BRITTON & CO.,

Corner of Battery and Pacific streets.

June 23, 1866.

Union Amalgamator.

This Valuable Invention

ITS FAST FINDING ITS WAY INTO GENERAL USE, NOT by means of combination of capital and influence, but on the strength of its own merits, and upon the principle that what is known to be good will be appreciated. Practical men acknowledge the UNION PAN to be scientific, the best, the cheapest, and most profitable. It now stands first on the list of all pans in use for the purpose of

Working Gold and Silver Ores.

It has been found that a low class of ores, also tailings from Mills, Sulphurets, etc., that will not pay to work with the common pans, may be worked with this and obtain large profits. The UNION PAN is manufactured in two sizes, and capable of operating upon large quantities of ore in the most efficient manner.

Parties interested in Quartz Mining, Mills, etc., will find it to their advantage to call and examine for themselves, and see its operation.

Gold and silver ores tested by regular mill process, at moderate cost, by
STRONG & CO.,
San Francisco Foundry, corner Mission and Fremont streets, where orders will receive prompt attention.

416 Market street, San Francisco.

FLORENCE

SEWING MACHINES!

COPY OF THE REPORT OF THE COMMITTEE OF AWARDS AT THE FAIR OF THE

AMERICAN INSTITUTE,

New York, 1865,

—TO TRY—

Florence Sewing Machine Company,

FOR THE BEST FAMILY SEWING MACHINE.

HIGHEST PREMIUM—GOLD MEDAL!

REASONS:

- 1st.—Its simplicity and great range of work.
- 2d.—The Reversible Feed Motion.
- 3d.—The perfect finish and substantial manner in which the machine is made.
- 4th.—The rapidity of its working and the quality of the work done.
- 5th.—The Self-adjusting Tension.

The "FLORENCE" was awarded the First and Highest Premium at the State Fair of California, the only Fair on the Pacific Coast at which any two double-thread Sewing Machines were exhibited in competition in 1865.

The "FLORENCE" received the only premium awarded by the Mechanics' Institute of San Francisco, in 1864 and 1865, to any Sewing Machine, Sewing Machine Company, or Agent. The claim of a competitor to a medal is without any foundation whatever.

Wherever the "FLORENCE" has been brought in competition with other Sewing Machines, it has always been declared the best. It is the most simple, the most substantial, the most efficient, and its use is easily learned. Every Machine sold is guaranteed in the full sense of the word.

Send for Circulars and Samples of Work.

FORGING AND IRON WORK.

THE PACIFIC FORGE COMPANY HAVE JUST RECEIVED, in this city, on Fourteenth street, near the machine shop of the San Francisco Railroad, a large establishment for the purpose of forging and working in wrought iron. Our hammer is the largest upon this coast, and we are prepared to manufacture, at short notice, all kinds of heavy forgings, ear axles, shafts, steamboat cranks, piston-rods, wagon axles and other similar work. This is the first general shop of the kind erected in this State, and we solicit the patronage of the public. All orders executed at reasonable rates, and with promptness and satisfaction. 19v12-3m

A FENNY DOG STORY.—When the war in Italy commenced, the Zouaves embarked for Genoa; but as they were going on board the ship, they saw a formal order forbidding the entrance of dogs upon the vessel. As they were very much attached to their dogs, they were stricken with grief. It was not very easy to deceive the sharp lookout kept by the intendant, for every soldier advanced along the narrow gangway, one by one, as their names were called. Necessity is the mother of invention. The drummers unscrewed their drums, and the best dogs of the regiment were concealed in the drums which were screwed up again.

When regiments embark no music is played, but on this occasion the Colonel determined there should be music. He ordered the trumpets and drums to take the head of the column, and play a lively tune. The faces of the drummers—every one of whom had a dog in his drum—may be conceived! The trumpets sounded; the drums were silent. The Colonel got angry, and howled to know why the drums did not beat. There was but one thing to do and that was to beat. The moment the drums began to beat innumerable dogs began to bay and howl, to the astonishment of everybody but the Zouaves. Everybody looked right, left, backward and forward—no sign of a dog anywhere; and yet the more the drums beat, the more the dogs howled. At last a spaniel fell out of a drum, rolled over and over on the ground, got up and took to his heels, howling louder than ever. Roars of laughter greeted this explanation of the mysterious howls.

The intendants ordered the drummers to advance on board, one by one, and each to roll the drum as he came. If a bark was heard, the drum was unscrewed, and the dog put ashore. Only one dog got on board; and that was Taunton, who kept quiet through all the rolling. It need not be said that the third Zouaves adore Taunton. He made his entry into Paris at their head a few days since.—*Paris Letter.*

MODE OF SEPARATING GOLD AND SILVER FROM THEIR ORES.—William Crookes, London, England: I claim the employment of zinc, tin and cadmium, and such other metals as hereinafter mentioned, and also of such several processes for the extraction of gold and silver from the ores and substances containing them, and for the treatment of mercury, employed for such purposes as hereinbefore substantially set forth and described.

J. B. COSE, BUSINESS AGENCY.—Makes private sales of Property and Business Places of every description, in the city and throughout the State; procures partners with large and small amounts of money; negotiates sales of mining property, and does a General Agency Business. Patronage solicited by mail, express, or by personal application at the office, 402 Montgomery Street, San Francisco, California. 23v1114

Apothecaries' Hall, No. 621 Montgomery street,
15v121y Between Clay and Commercial, San Francisco.

Postage.—The postage on the Mining and Scientific Press to any portion of the United States is twenty cents per annum, or five cents per quarter, payable in advance at the Post Office delivering the paper. Postage free in the city and county. Foreign postage (with few exceptions) two cents per copy, prepaid. To Bremen and the German States (marked via Bremen and Hamburg line), three cents per copy, prepaid. Single copies to any address in the United States, two cents.

Knox's Improved Patent Amalgamator and Separator,

With Palmer's Patent Steam Chamber or Die.

For further particulars, inquire of

14v13-pl2q

ISRAEL W. KNOX, or
W. A. PALMER, Inventors,

At the Golden State Iron Works, No. 19 First street, San Francisco.

THIS CUT REPRESENTS AN AMALGAMATOR AND SEPARATOR THAT HAS STOOD THE TEST OF SEVERAL YEARS' PRACTICAL WORKING IN THE GOLD MINES OF CALIFORNIA, AND FOR NEARLY THE SAME TIME IN THE SILVER MINES OF NEVADA, HAVING BEEN INTRODUCED INTO THE FIRST STEAM MILLS BUILT IN THE THEN TERRITORY, SINCE WHICH TIME THEY HAVE BEEN SUCCESSFULLY WORKING AGAINST ALL COMPETITION.

The great advantages these Amalgamators have over any others, are—

1st. Much less Cost.

2d. They do not "flour" the mercury, and collect any that may have been "sickened" in the battery or grinders.

3d. The "sloshing" motion given to the pulp (by the revolution of the muller under the stationary frame) against the amalgamated copper plates that are fastened to the frame, and by this means catching the fine gold and mercury that will not settle.

4th. The gate in the cone, through which the pulp is discharged, from the top, and where there is the least motion, almost precluding the possibility of any granulated mercury or the gold escaping.

There are over 500 of them in use in California and Nevada, where those interested can see their practical workings.

VARNEY'S CONCENTRATOR,

With a disk 4 1-2 feet in diameter—total weight of Machine 350 pounds.

Is driven by one eighth of a horse-power, and will concentrate eight tons of ore per day, and make the sulphur clean. Larger ones do work in proportion to size.

IT CAN BE SEEN IN OPERATION AT THE PACIFIC IRON WORKS, SAN FRANCISCO. 23v12-3m

HORTON'S PATENT

CALENDAR CLOCK!

MANUFACTURED BY THE

ITHACA CALENDAR CLOCK COMPANY,

Ithaca, N. Y., and for sale by

W. J. EGBERT, Agent,

At JOB M. SEAYAN & CO.'S, 631 WASHINGTON STREET, San Francisco.

THIS TIME PIECE costs but a trifle more than any other good clock, and is just the article for every well-regulated business house, office, saloon, or, in fact, any place where a handsome, perfect timekeeper is duly appreciated. The Clock has two dials, the first being the same as an ordinary clock; the second has but one pointer, and shows the day of the week, the month and day of the month. It is arranged to mark the days in leap years with equal regularity. It is an eight-day piece, and runs from year to year without change. It can be examined at the Office of the Mining and Scientific Press.

The Hansbrow Pumps

**STANDARD SOAP COMPANY'S
WASHING POWDER.**

THIS POWDER IS SUPERIOR TO ALL OTHER PREPARATIONS for washing and cleansing. It is made of pure material, and contains nothing that will injure the finest fabric. Equally as good for use in hard as soft water. One pound will make three gallons of beautiful soft soap. Put up in wrappers of 1-lb each, and in wooden boxes of 10-lb bulk. Ask your purveyor for a package, and test its virtue. Manufactured at 207 Commercial street, San Francisco. 15v124

Eyes! Eyes!! Eyes!!!

DR. HENRY, Oculist and Aurist, HAS received from Scotland one of the most MIRACULOUS REMEDIES for the benefit of the HUMAN EYE ever before discovered. It is unparalleled in its effects upon the diseases incident to this organ. It gives wonderful power to the optic nerve, and removes all the granulations from the lids, and all unclean film from the sclerotic coat without the use of instruments. In fact, it works like a charm on the Eye, without giving any pain. You feel the effect of the medicine in different parts of the head. It drives the disease back into the system, which is better able to stand it than the tender organ. Why will you suffer when you can be cured in a few days. Persons who have been blind for ten years have been restored to their sight in a short time by the use of this medicine. I will treat any person's eyes in the State, and if I do not give them relief in a short time, I will not charge them ANYTHING. Office, No. 751 CLAY STREET, opposite the Plaza, San Francisco. 22-v12

Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make.

HOADLEY'S.

FOUR SIZES,

8, 10, 12, and 15-Horse Power,

HOADLEY'S.

3 to 40-Horse Power.

HITTINGER'S.

THREE SIZES,

5, 7, and 10-Horse Power

HITTINGER'S.

TWO SIZES,

5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, and Economy, with the Minimum of weight and price.

These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes.

Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction accounts" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises), in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with and without carriages.

Also, Portable Saw and Grist Mills.

MINING AND SCIENTIFIC PRESS PATENT AGENCY.

For the Pacific Coast.

OFFICE OF THE MINING AND SCIENTIFIC PRESS—No. 505 Clay street, corner of Sansome, San Francisco.

Information for Inventors!

Inventors on this coast, having their applications for patents made out through our Agency, can sign their papers at once, and thus secure their rights at least three months sooner than by trusting the same to distant agencies, situated in New York or Washington. The first question that presents itself to the inventor is, "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Caveats.

A caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the inventor to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveat is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from \$10 to \$20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftentimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian, Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from \$20 to \$40. In no case is granted no further agency expenses ensue. If the application is rejected we cause thorough investigation to be made into the reasons presented to the Commissioner for rejecting the patent. In making this examination, our Washington agent has access to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client.

If the rejection appears to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

If the system adopted by us gives general satisfaction, and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorneys, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms to such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions; it should be neatly made, of hard wood or metal, or both, varnished or painted, the name of the inventor should be engraved or painted on it conspicuously. When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: Dewey & Co., Mining and Scientific Press, No. 505 Clay Street, corner of Sansome, San Francisco, Cal. Prepay expenses and send express receipt to us by mail. Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued, the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication; the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time, but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance.

The following is the Government tariff of fees established by law:

On every application for a design, for 3 years and 6 mos.	\$10
On every application for a design, for seven years.	15
On every application for a design, for fourteen years.	20
On every application for a patent, for seventeen years.	15
On every caveat.	10
On issuing each original patent.	20
On filing a disclaimer.	10
On every application for a re-issue.	30
On every addition to a patent granted on a re-issue.	30
On every application for an extension.	50
On the grant of every extension.	50
On appeal to the Commissioner from Examiners-in-Chief.	20
On every appeal to the Judges of Circuit Court, D. C.	25

We have had successful experience in conducting these appeals and our services are rendered on moderate terms. N. B.—We make out our own forms for applications, etc., and would respectfully inform all parties that we have no printed blank forms for sale.

CITY IMPROVEMENTS.—So much is being done in different parts of San Francisco to improve and beautify the city, that one hardly knows where to begin to enumerate them, and anything like a full reference would require columns, even in the daily papers. Langley will not lack for material in this respect to fill an important department in his next Directory. On every hand we see going up substantial and ornamental structures, which speak volumes for the growth, prosperity, and permanency of the Golden City. Streets are being widened, substantially paved, and more properly graded in every direction. At no time in our past history has there been a greater activity in such enterprises than is now to be seen. Of course, the more permanent improvements are being made at and near the business centre of the city. This point, at least so far as the banking business is concerned, is now on California, between Montgomery and Sansome streets. There we have first the splendid structure of the Bank of California, now beginning to develop the beauty and grandeur of its proportions, and which will cost a quarter of a million of dollars. Next we may notice the structure of the California Building and Loan Society, which association has accomplished untold good for the poorer classes of our citizens in enabling them to erect homes for themselves. The old brick building adjoining has recently been purchased for \$65,000, by the Firemen's Fund Insurance Company, and that corner will soon assume an ornamental appearance. The Bank of British Columbia, on the opposite corner, paid about the same sum for their premises. The Pacific Insurance Company are erecting an expensive building on the corner of Leidesdorff and California streets. On the site of White's livery stable, opposite, the erection of another fine structure has been commenced, for the Merchants' and Brokers' Exchange, which will extend one hundred and twenty feet front on California street, by one hundred and thirty-seven deep. The building and lot will cost \$300,000. All these improvements are going on within the distance of a stone's throw, and may give some idea to distant readers of what is being done in the way of building improvements in San Francisco.

Colored children are not admitted to the public schools of Brooklyn.

A CALIFORNIA PATENT BALING PRESS.

We give, herewith, an illustration of a cheap and apparently effective baling press, invented by Erastus M. Day and John P. Noel, of Lower Lake, California, patented February 20, 1866, and first illustrated in the *American Artisan*, of New York, in May last.

As the season is now at hand when our farmers and others are making arrangements to prepare their hay crops for shipment, we have thought it might be of service to call their attention to this California invention, which, as will be seen from the engraving, is exceedingly simple, compact and portable. By reference to figure 1, it will be perceived that the

which keep the pawls up to their work. It is a eum which disengages the pawls from the ratchet, when the follower is to be pushed back to make room for a charge of the material to be baled. *b* and *d* are eccentrics, fixed on the rock-shaft, *a*. *G* is a hand-lever, also fixed on the rock-shaft, to work it. On each of the eccentrics, *b* and *d*, are two pawls, one being longer than the other by half the length of a tooth of the ratchet, in order that the ratchet may be moved the length of half a tooth at a time; this expedient is preferred to making the ratchet teeth smaller, and therefore liable to wear out sooner. As the eccentric, *d*, is opposite the eccentric, *b*, on the rock-shaft, it will push its pawls forward while *b*

Fig. 2

movement of the follower which presses the material is horizontal. The door through which the bale is taken out is at the further end, opposite the follower, so that the pressure is exerted toward the door; and when the bale is corded, the door is opened, and the follower is worked farther forward, and pushes out the bale. The material to be baled is put in at the top; a lid, with proper fastenings, being fitted at the top. The whole arrangement is convenient; the height at the top being the height of a bale added to the height of the bed-frame of the machine.

The means by which the power is applied are shown in Fig. 2. *A A* is part of the bed-frame furthest from the pressing box. *F* is part of a ratchet-bar which is fixed upon and gives motion to the follower. *f f* are pawls which catch into the ratchet. *r r* are springs

draws its pawls backward; and, on the other side, *b* will push its pawls while *d* draws its pawls back; and when the lever is not worked, one of the pawls of each eccentric, or two pawls, will hold. Thus, by moving the hand-lever either way, to the proper extent of its movement, the follower is moved half a tooth; another pawl, on the other eccentric, then catches into the ratchet; the lever is then thrown the other way, pushing the ratchet half a tooth further; and so on until the bale is sufficiently compressed. The bale is then corded, the exit door opened, by knocking away the latches, and the bale is pushed out by further working the ratchet.

For further information, address, by letter, H. Winchester and E. M. Day, Lower Lake, California.

FROM ARIZONA.—We have had the pleasure of a call from Mr. JOHN A. MAHON, one of the pioneers of Arizona, who has been engaged in mining in that part of the country for eleven years. He has placed us in possession of a large mass of information with regard to the present condition and future prospects of mining there, which we shall lay before our readers next week.

THE BREAST-PLATE REVIVED.—A letter from Italy to an English paper says that breast-plates are being revived as in the glorious times of the knights of the Round Table and the Plantagenets, and that the director of the Genoa penitentiary has succeeded in devising a breast-plate for soldiers, which scarcely weighs three English pounds. After repeated experiments, practiced on it with heavy cavalry pistols at five paces, and lances, bayonets and swords, it has been discovered to be utterly impenetrable both to bullets and thrusts. The most striking peculiarity of this breast-plate, which can in no way impede the movements of a soldier, is that not the slightest atom of metallic matter enters its composition.—*Eastern Exchange*.

ALUMINUM ARMOR.—A trial has just been made at Florence of a cuirass in aluminum, which is as light as an ordinary waistcoat, nearly as flexible, and capable of turning a musket ball fired at the distance of 38 paces, and of resisting a bayonet thrust from the heaviest hand. Each cuirass costs only 25 frs. Two regiments are, it is said, to be immediately provided with them.—*London Mining Journal*.

Both the above paragraphs, undoubtedly refer to the same thing, although one contradicts the other. The metal aluminum has been observed, alloyed with iron in Indian steel, and it has been said that the excellent qualities of that steel are due to the aluminum contained in it. Experiments made several years ago have shown that iron, combined with aluminum, was greatly increased in tenacity. Both theory and experience indicate the softening and strengthening influence of all alkaline metals, from aluminum to potassium; but in large operations, and in the reduction of oxides, the great difficulty has been, that in reducing them it has been found impracticable to obtain them free from silica, which not only paralyzes the good effect which might be otherwise obtained from the alloy, but often renders the alkaline metals disadvantageous to the ductility and strength of the metals with which they are combined. It has long been supposed that if metals could be reduced in the presence of alkaline substances, from sulphurets, phosphates or chlorides, there would be a possibility of obtaining alloys free from silica, and therefore possessing a great degree of strength and toughness. It is possible that the Italian experimenters may have made some new discoveries in this direction. An alloy of copper and aluminum of considerable toughness is even now well known to metallurgists.

SAILOR QUARTZ LEDGE.—Among the recent, and prospectively rich developments in quartz, we hear of the Sailor Ledge, near Downieville, Sierra county, as follows:—

Energetic prospecting has opened to view a vein of quartz rich in various sulphurets, tellurium and free gold. The width of the vein is from ten to twelve inches, incased on the west by a wall of serpentine, and on the east by talcose slate, gradually changing to silicious and clay slates. The hanging wall is strongly marked with clay seams, which are all held as infallible evidences of a true fissure. The exploration of the ledge has been by a level run directly on the vein. The ore is now being tested at the Montpelier Mill, and soon the results will be known. The only seeming difficulty possible is in the extent; for the vein, as now exposed, is of the richest quartz. The situation of this ledge is most propitious; wood and water in inexhaustible quantities are near at hand. The proprietors are confident of success, and so far their hopes seem to be well founded.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Notes on the Chief Gold Districts Throughout the World.

BY PROFESSOR ROWLANDSON, F. G. S. L.

[Continued from page 60.]

ITALY.

It was not intended to have made further allusion to this portion of Europe, but have let it pass with the notice previously given of the Norian Alps, which include a portion of the northeastern part of the Italian peninsula at the point where the Apennines intermix with the branches of the Alps already named. As, however, I observed in a recent number (November 18th, 1865) of the *London Mining Journal*, a satisfactory report of the working of gold mines at Vallanzasca, Val Toppa and Val Antigoria, it may not be out of place to make allusion to the circumstances that it was not long ago stated that there had been found in the gneiss of some part of the Apennines organic remains, which indicated a Jurassic or Cretaceous age.* If this statement is correct, it would go far towards establishing the truth of the theory which I have set forth respecting the age of gold-bearing rocks.

The same number of the same journal also contains a report respecting some copper mines in Tuscany. The circumstance is alluded to for the purpose of drawing attention to the great similarity which exists between this part of Italy and some parts of California; thus, a section drawn from the Noric Alps to Sessa, in the Florentine in Italy, and another from Mariposa across Calaveras, Amador counties, etc., to Clear Lake, in each case the line will pass through an auriferous to a copper region, terminating in both instances in a boracic acid-producing district. It is true, that, in the latter instance, the lagoons of Tuscany yield boracic acid only in mechanical association with a few foreign substances, whilst at Clear Lake, it is, as at the Tineal lakes of Tibet, found in a chemical combination with soda, in the form of bi-borate of soda (Borax), a variation for which it would not be difficult to assign a probable cause. All the three boracic districts named probably belong to tertiary formations.

The analogy may be carried a step farther, as both in Italy and California the districts alluded to are accompanied in places by quicksilver ore. The last named fact is sufficiently interesting and allied to the subject under consideration, to merit a lengthy quotation of a paper by Olier von Hauer, in the *Proceedings Imp. Geolog. Institut, Vienna*, and translated in the *Quarterly Journal of the London Geological Society*.

ON A QUICKSILVER DEPOSIT NEAR AIRDALE.

If my recollection is not at fault, a few years ago mercury was found under nearly similar circumstances at the foot of the Pyrenees, near Toulouse. I call attention to this fact, for, notwithstanding the statement of Crimm about the cinnabar mines at Idria being found in sub-carboniferous rocks, not only is the assertion unsupported, but it is opposed to the well-known geological surroundings of that vicinity. Lignite beds and shales of Cretaceous and Miocene ages have most probably been mistaken for the true carboniferous formation.

In a communication in the same journals, Dr. M. Hornes described some gasteropods from the Alpine Trias, collected at Unterpetzen, near Sebarzenbach, at Mount Obir, northwest of Eisserkappel, in Lower Carinthia, a series from Esino, in the Val Pelaggia, on the eastern border of the Lake of Como, and some fossils from the Hallstadt strata, found at Sandling and at Seltsechen, near Ansee, in Styria.

The Esino fossils were found in a dark-gray or black dolomitic limestone, in the detrital accumulations (Schulbalden), on the northern slope of the Val Pelaggia—the limestone

being intersected by veins of white calcareous spar, yielding a slight bituminous smell when struck with a hammer.

The fossils found indicate that the Hallstadt and the St. Cassian strata are closely related, and that in a paleontological point of view, the dolomitic limestones of Esino, Hale (Tyrol), Venterpetzen, etc., are members of the St. Cassian series. In a prior paper (No. 5, June 24th, 1865) will be found some remarks at greater length respecting the peculiarities of the St. Cassian and Hallstadt beds, and probably may be referred to hereafter.

The *Bulletin of the Geological Society of France* contains a communication on the sedimentary formations of Lombardy, and on the structures of the southern flanks of the Alps, from the Tyrol to the vicinity of the Lago Maggiore, in which the author, M. Ombroni, describes the following formations in descending order: 1, Recent deposits; 2, Etratic formations; 3, Tertiary; 4, Cretaceous deposits; 5, Jurassic; 6, St. Cassian (Cassian) groups; 7, Triassic; 8, Permian; 9, Carboniferous; 10, Crystalline formations. Aside from the last mentioned, the only two groups belonging to the paleozoic series are 8 and 9, both of which are above the Silurian series. Not having the *Bulletin* to refer to, I cannot say to what extent the Permian and Carboniferous cover the area alluded to, nor the relation which they bear to the golden placers and auriferous veins of Northern Italy; the general geological feature of that part of Europe, so far as it has been well worked out, countenance the strong probability that the paleozoic portions are of limited extent, and sparsely distributed, so that the chances in the absence of positive evidence either way are more favorable to gold-bearing veins in Northern Italy, being found in ascendancy in place of paleozoic strata.

In connection with this subject it may be well to make a brief statement in reference to the anthraxiferous formations of the Alps, whose position has caused no small amount of geological controversy. M. Scipion Gras, comparing them to the Verrucano of Tuscany, and from the fact that true carboniferous fossils having been found in the Verrucano, he infers that the thraxiferous beds of the Alps belong to the same carboniferous zone. The age of these beds has occupied the attention of very many eminent geologists, especially within the last ten years. In the course of a communication from M. A. Sismonda to M. Elie de Beaumont, the former gave an account of the fossils from the Col des Encombres (Savoy), and the Col de la Madelaine, in the valley of the Stura (Piedmont), on the route leading from St. Michael-Maurienne to the Tarentaise, from which Sismonda confirms the opinion of Elie de Beaumont, that the anthraxiferous formation of the Central Alps cannot be referred to a more remote period than the Lias (Jurassic). The fossils are described as occurring principally at the junction of the dark schistose crystalline limestone with the calcareous beds called *calcaire de Villette*, and M. Sismonda concludes that the anthraxiferous beds of the Alps are nearer than those of Jans in Tuscany, the latter being below the Verrucano, which he identifies with the infra liassic conglomerate of Valorsale and Ugine, whilst in the Alps the anthraxiferous beds are above the conglomerate. The Jans fossils are decidedly paleozoic; the only resemblance between the two formations from which a comparison has been drawn consisting in their flora, which, as is well known to geologists, forms a much more uncertain index of age than when the latter is inferred from animal remains.

In all the explorations connected with the geology of Northern Italy and the Alps, with the exception of the Jans beds of Tuscany, no reliable data respecting the existence of paleozoic strata appears, notwithstanding the district has been thoroughly examined by numerous and experienced geologists, whilst the Jurassic appears to occupy large areas under conditions apparently greatly similar to what is found in California. The anomalous superior Triassic or inferior Jurassic beds, known as the Hallstadt and St. Cassian series, appear also to be widely diffused, and, in many respects, greatly resemble the conditions presented by the metalliferous region connected with the Sierra Nevada. Some general observations on these latter points will, however, be reserved, until notice has been taken of the auriferous districts found in Hungary and Transylvania.

Another striking point of resemblance between the geological features of Northern Italy and California consists in the character and association of the igneous and metamorphosed igneous rocks found in the two countries, particularly those related to the augite and hornblende series, through all their changes into diatase, bronzite, serpentine, gabbro, etc., the last term being derived from the city so called, around which a mixture of diatase and serpentine (Gabbro) covers a considerable area. Similar phenomena are to be found

within the limits of the city of San Francisco, accompanied, also, he it remembered, by mercury, and possibly gold. This subject will, however, form a separate paper after this series is finished, when the question of the association of mineral, and especially auriferous veins, with hornblende and its cognate rocks, will be more fully entered upon. A general resume, however, of the geological features of the extensive European auriferous district connected with the Alpine Trias and the igneous rocks and serpentines associated therewith, will be given after detailing some facts relating to the rocks associated with gold in Hungary and Transylvania.

[To be Continued.]

Letter from Dr. C. T. Jackson—Correction.

EDITORS PRESS: On reading your paper of the 2d ult., I see that you have copied a very erroneous statement from some of our newspapers, relating to two letters of mine written to the Academy of Sciences of France, during my visit to California and Nevada. I did not notice this article when it appeared in the common newspapers, nor then correct its errors, but when it has been copied into a paper of such high scientific standing as the *MINING AND SCIENTIFIC PRESS*, I feel that it ought to be corrected, since it might lead the good people of Austin to imagine that I must be not only ignorant of the situation of their mines, but also of mineralogy, if they should believe I ever made such statements. In my letters I stated that the silver ores of Austin were sulphuret of silver, and red antimonial sulphuret of silver chiefly, which, on decomposition, by agency of air, water, and the saline matters in the soil, produced sulphate of silver, chlorides, iodides and bromides of silver in the surface rocks, and that if specimens of these ores were heated to full redness in a forge fire, they became quickly covered with globules of metallic silver.

I stated that the high cost of reduction of the silver from the Austin ores was due to the fact that the ores had to be roasted previous to amalgamation, and that the fuel had to be brought from distant mountains.

I do not know what the Austin people will think of the allegation in the article you have copied, that the "ores have to be brought from the mountains a long way off," when the Silver Mountain's Lander Mill, Union Mill, and Central Mill, are all three in the town.

The produce of the ores is stated correctly—they average nearly \$200 per ton, and there are picked samples that will run as high as \$1,300 per ton.

My two letters addressed to the perpetual Secretary of the Academy of Sciences of France were correctly translated by him and read to the Academy, and most cordially accepted and printed in the *Comptes Rendus* of November and December, 1865, and have been copied into most of the scientific journals of the continent of Europe. One of the letters is on the mineral resources of Nevada, and the other on those of California.

I have read several papers on these subjects before the Boston Society of Natural History, and the American Academy of Arts and Sciences of Boston, abstracts of which communications have been printed in the proceedings of these Societies, with my supervision of the proof-sheets.

I have still more elaborate work to perform, and it is now in progress of preparation, of minute detailed descriptions of the mines of Nevada and of California which I have examined. I was in hopes that some of this information would have been called for by persons desirous of investing in the mines but there has been no demand for any information, and worthless mines sell just as well, if not better, than good ones, and the worthless ones costing little, do just as well for foot-halls to stock-jobbers.

This shameful treatment of our mining interests calls loudly for a remedy. It is the ruin of legitimate mining, and ought to be stopped by the strong hand of the laws of the country.

Mining will ultimately be understood to be one of the great interests of this country, and should not be regarded as a mere gambling business. May the day soon come!

Your obedient servant,
Boston, July 3, 1866. CHAS. T. JACKSON.

Linear vs. Square Claims.

We have received the following communication from a correspondent at Marysville, with regard to the second section of the New Federal Mining Law.

EDITORS PRESS: In your issue of the 14th inst., in speaking of the objections urged by the Marysville *Appeal* against the second section of the Senate Mining Bill, you say, not to allow the miner to follow the dip of his vein under the ground of his neighbor, would he a system or law that no one with any experience in mining would think to approve of, and that on the contrary you look upon this section as one of the most important provisions of the bill, and that without it, no mines can be worked effectually.

I find already, that the Nevada *Gazette* is not entirely of your opinion, for alluding to the objections of the *Appeal*, it says:

"The pay chimneys, at a certain depth, will leave the company's ground, but while the company would have a right to follow the ledge indefinitely, they would not, either by the present mining laws or by the new mining bill, have the right to follow the chimney when its dip took it off their portion of the ground." But the *Gazette* also says, that in a communication on the subject to the *Appeal*, I was confounding the dip of a vein in its downward course, with the inclination of a pay chimney, or did perhaps not clearly express my meaning on a subject that only can be well explained by the use of a diagram. Such a diagram I herewith forward to you, hoping that it will help you to better understand my own and the *Appeal's* objections; as to the dip, or the meaning of it, the only question in dispute, it would be more easily understood by everybody, if the incline shaft on my diagram was sunk along one of the pay chimneys in a northeasterly direction, instead of being sunk in a straight easterly one.

Being myself of foreign birth, I had a slender confidence in my ability to define the real meaning of the word, and therefore consulted a native American friend at my elbow, and he tells me that in mining, "To dip means to sink or to incline as a stratum of rock," and this being the case, I hope the slope or inclination on my diagram will sufficiently explain the downward course of my pay chimneys, and also conclusively show that the provision in section 2d, "although it should enter an adjoining claim, cannot fail to create conflict and confusion."

[Our correspondent here goes into a lengthy description of the diagram which he sends us; which we do not insert from the fact that we have no engraving of the same, upon which the reader can follow his remarks.]

What a large field for argument would that section 2 not offer to a smart lawyer!

It is true, that under this new bill rights acquired under the rules and regulations of our present laws would be respected, but why not share rights to be acquired in future at once in such a way as to prevent all controversy, and say, for instance, that dips, angles and variations may be followed up as long as they do not enter adjoining lands already claimed, thus avoiding, at least as much as possible, confusion and endless litigation.

The difficulty of making myself better understood, simply arises from the fact, that but few miners as yet seem willing to admit of this oblique theory. There are pay chimneys, the strike or plane of which are of 50 as well as of 500 feet in length. You may cross them in all directions nearly the same; if but of fifty feet, you will by your incline shaft easily and soon determine its length; if 500, it will very naturally require some time before you can ascertain it and see whether your ledge or chimney is a horizontal or an oblique one; if found to be oblique, you will know that there is no reason for despair, for you then also know that the works for reaching, its extension may be easily and with perfect confidence planned in advance.

To the fact that these chimneys are mostly of larger dimensions, or follow each other so near (often separated from each other only by twenty feet, more or less, of country rock), that in many cases, no serious anxiety has been felt for losing their extension—to this fact, I say, may be ascribed the cause, that so far, so little attention has been paid to their oblique chimneys; however, it can certainly not be denied, that many a good claim has been abandoned for ignoring their existence.

The square claim location, with arbitrary

* The celebrated Carrara marble quarries belong to the chalk series as well, as a large part of the Apennines and other portions of the Italian peninsula.

limits on the surface can, so it seems to me, scarcely be improved.
M.
Marysville, July 24th, 1866.

REMARKS.—Since the above letter was written, the bill referred to has become a law, and all controversy as to the effect of any of its provisions, before giving them a practical trial, would seem to be useless. Still we would insist upon our previously-expressed opinion, and furthermore, believe that nineteen-twentieths of all the miners on the Pacific coast agree with us, that the system of location following the direction of the vein, with its dips and angles, is preferable to any mode which involves the square claim location.

We do not see how our correspondent can gain anything for his "chimney" theory from square claims, as his chimneys, most certainly, at times, run beyond his "fixed lines" into his neighbor's ground. With regard to what may appear upon the surface to be parallel veins, but which in depth run into a common lode, as is probably the case with the Comstock, at Washoe, the new law allows the first locator to make his claims as wide as he thinks best on the surface; and it will be his own fault if he fails to make them wide enough to cover all the parallel out-croppings of his main lode below. There is very little difficulty to be apprehended on this score, and as there must be a limit, longitudinally, we do not object to arbitrary lines, especially when we take into account the difficulty of determining what may constitute a chimney.

We can see any amount of litigation which might grow up were it left to jurors to decide what was or was not a chimney; when the decision of that question might increase or decrease the extent of a claim, by its greater or less inclination along the direction of the vein.

CARE OF THE BODY.—While riding on a locomotive recently, and talking with the engineer, as I had the privilege of doing, I could not but think how much wiser men were about iron and steel machinery, than they were about fleshy and osseous machines. The relation of the pump to the capacity of the boiler; the relations of the size of the flues; the relation of the cylinder, or of the steam generated, to the work to be done—all these things were in the engineer's mind. He was continuously watching every part, and opening and shutting valves on every side so as to keep every part in its proper condition. The stoker, or fireman, was applying or withholding food, so as to keep the engine in just that state in which it would work the best, according to whether we were running up-grade, or down-grade, or on level ground, and according to the number and weight of the cars being drawn, for we were drawing a long and ponderous train.

Now, how many are there who watch their furnace, to see that they get in neither too much nor too little fuel? Men shovel in food without any regard to what it is going to do! If it is the Sabbath day, when they are quiet, when their stomachs are not in a condition to digest so much food as other days, they eat a double portion. If it is a day when they are to undergo severe taxation and work, and when they can least afford to go without food, oftentimes they become anxious, and neglect to eat because they become too anxious. As a general rule, when the body needs the basis of food less than at any other time, they eat the most, and when it needs more than at any other time, they eat the least. Our food is a means to an end. It is simply the fuel with which we are to raise steam for carrying on the purposes of life.—[Exchange.]

CAUSED BY A FINE CRACKER.—The late disastrous fire at Portland was caused by a fire-cracker fired by a boy on the Fourth of July. It was thrown into some shavings, the burning of which kindled that terrible conflagration, which raged for twenty-four hours, sweeping over 200 acres of ground, destroying 1,500 buildings, and rendering houseless about 9,000 persons.

THE LIBRARY OF THE MECHANICS' INSTITUTE has been removed from the Institute Building, on California street, to 636 Market street, between Montgomery and Kearny, where it will remain until the completion of the new building of the Institute now being erected.

Two children in Chicago have been poisoned by putting a card photograph to their mouths. One died.

Mechanical.

A NOVEL PUMPING APPARATUS.—THE *Yreka Journal* says that J. C. Carroll, of Scott Valley, has perfected a model of machinery for a new style of motive power from water. It consists of pipe laid from a ditch, stream or reservoir, similar to hydraulics, in the end of which are two cylinders, with a branch pipe to each. In the branch pipes are valves, which are so arranged as to allow the water to rush into each cylinder alternately, driving down plungers attached to a walking-beam above. As each plunger reaches the bottom of the cylinder the lower valve opens and lets the water out, while at the same time the upper valve closes, thus shutting the water off into the other cylinder.

THE IRON HORSE, with his tireless strength, its pulch of vapor, and its heart of flame, is a glorious exponent of the creative capacity of the human mind; and the metallic nerves, through which intelligence courses over a continent, prove, by every flash of thought which traverses them, that man possesses one attribute essentially godlike, the power to annihilate space and time. But vast and important as have been the results of making steam and lightning the common carriers and messengers of the world, they are both, after all, but mere subsidizing agents. The one is but a great motor; its usefulness consists, mainly, in conveying substantial benefits, with speed and certainty, to the fields in which they are to operate; while the other is simply the bearer of blessings, not their originator.

MECHANICAL EFFECTS OF HEATED AIR.—M. Babinet has communicated to the Paris Academy of Sciences an account of experiments by M. Mouchot, Professor of Mathematics at Alençon, on the mechanical effects produced by confined air heated by the rays of the sun. In these experiments, M. Mouchot employed a cylindrical vessel of this silver, blackened on the outside, and enclosed within two cylinders of glass, placed one inside the other. The office of the glass cylinders, of course, was to prevent the heat which might pass through them to the blackened silver cylinder being radiated back again,—glass, while affording a free passage to the direct rays of the sun, being practically opaque to radiant heat. The silver cylinder was half filled with water, and an air-tight cover was then fitted on it; a tube, fitted with a stop-cock, passing vertically through this cover to very nearly the bottom of the vessel. Thus arranged, the apparatus was placed in the sun, whereupon the air in the upper part of the vessel speedily became heated sufficiently to cause it to exert so much pressure on the water under it, that the latter, on the stop-cock in the tube passing through the cover of the vessel being opened, escaped in a large jet more than ten metres high. This very remarkable result led M. Mouchot to construct an apparatus on the same plan which yielded a continuous jet of water as long as the sun was shining on it. M. Babinet is of opinion that machines on this principle might be found useful for raising water on the great scale in tropical countries.—*Mechanics' Magazine*.

CLAY which when not compressed had a power of conducting heat equal to 26, had when compressed with 7,500 pounds per inch, a power equal to 33; and the conducting power of a mixture of sand and clay in equal quantities, rises from 36 to 378, by an increase of pressure from 4,300 pounds to 7,500 pounds per inch.

A BRASS made of sixty parts copper, thirty-eight parts zinc, and two parts iron, may be forged at a red heat, and will support a "breaking weight" of twenty-seven tons per square inch. This has been used with success for bolts in the fire-boxes of locomotives.

THE violence of the expansion of water when freezing is sufficient to cleave a globe of copper of such thickness as to require a force of 28,000 pounds to produce a like effect.

THE tenacity of cast copper is sufficient to support a weight of 19,000 pounds to the square inch, or rather more than half as much as good cast iron.

FROM Professor Airy's pendulum experiments at Harton Colliery, the mean specific gravity of the earth is found to be 5.566.

OVER two hundred mechanics and operatives are in constant attendance at the Cincinnati School of Design.

Scientific Miscellany.

A New Kind of Galvanic Battery.

M. Bultinck, of Ostend, has communicated to the Academy of Sciences a note on the use of magnesium instead of zinc, as the positive element of voltaic batteries. In order to compare the electro-motive force of magnesium with that of zinc, he employed two pairs of wires, one pair consisting of a wire of copper and one of zinc, and the other pair of a wire of silver and one of magnesium. On plunging the first-mentioned pair of wires into distilled water, having first connected them with a multiplying galvanometer, the needle of the galvanometer, at the moment of the immersion of the wires, moved thirty degrees, and after the immersion had lasted five minutes still marked ten degrees. On similarly treating the silver and magnesium pair of wires, which were exactly of the same dimensions as the copper and zinc pair, at the moment of immersion the needle of the galvanometer deviated ninety degrees, and five minutes after immersion it remained stationary at twenty-eight degrees. Having thus found the electromotive force of a silver and magnesium couple to be three times that of a copper and zinc couple, M. Bultinck became desirous to construct a large battery with magnesium as the positive element, but not being able, for the moment, to obtain magnesium in any other form than that of thin wire, he had to be content with making a "galvanic chain," of the kind associated with the name of M. Pulvermacher. Having constructed such a chain of silver and magnesium, he found that when simply moistened with pure water it would produce all the effects the production of which by an ordinary Pulvermacher's chain requires that the chain be moistened with either a saline or an acid solution. We knew previously that magnesium possessed greater electromotive force than any other known metal capable of being obtained in quantity; the new fact brought to light by M. Bultinck, is that a battery in which magnesium was the positive element would not need an acid to excite it, but could be excited by water only.

THE HEART.—The beating of the heart and the drawing of the breath proceed in a daily cycle of variations, very nearly as follows: From seven to eight in the evening the pulse and breathing begin to go slow, and continue to do so until about two o'clock A. M., when both reach their minimum of slowness. From that time to daylight a slight increase is noticed. Between daylight and sunrise the pulsation is increased about ten beats a minute. At breakfast, and especially during the meal, the pulse increases rapidly, until the second hour after dinner, when the maximum speed is obtained. From that hour it begins to decline, and losing by the dinner hour twelve and a half, ten or fifteen pulsations per minute. After dinner the rate rises again, and reaches the highest point on the second or third hours. Then comes a new increase until tea time, after which another increase, and then a final decrease, to the hour of seven or nine P. M.

THE NORTH POLE.—A couple of scientific gentlemen, who have recently visited the island of Spitzbergen, on a tour of scientific inspection, have found that a very considerable degree of heat is produced there by the continuous shining of the sun during the six months' day which prevails in that latitude. During this period a vegetation very luxurious and abundant springs up. Another singular fact noticed was the immense quantities of drift-wood which appears everywhere on the coast, and in the bays of the island. They also express the opinion, that the North Pole, only 600 miles distant, could be easily reached by an expedition which should leave that point in the early spring. Such an expedition will soon be fitted out to make the experiment.

THE famous German chemist, Mitscherlich, at the conclusion of a paper discussing his observations of the "spectral line" given by various non-metallic bodies, states that he believes all the so-called non-metallic elements to be compounds.

THE editor of the British Journal of Photography speaks in terms of high approval of the rectified wood spirit, or methylic alcohol, as a solvent for gun-cotton in making collodion, in place of the usual mixture of alcohol and ether. In these times of dear alcohol this is an important matter to photographers. This, it will be recollected, is the agent which the inventor of nitro-glycerine employed, in his New York experiments, to render that terribly dangerous explosive material harmless, while being transported from place to place, or on storage. He claims that when nitro-glycerine is mixed with methylic alcohol it cannot be exploded, while at the same time it can readily be separated from that liquid when wanted for use.

ALCOHOL.—Every writer on toxicology classes alcohol as a poison. A very small quantity of alcohol injected into the veins of man or beast, produces almost instant death. Healthy saliva reddens litmus paper, but after a small quantity of alcohol has been taken into the stomach, litmus paper touched to the tongue becomes green, showing that the saliva has become deteriorated. Alcohol mixed with the gastric juice produces a precipitate, and renders the fluid incapable of digesting animal or vegetable matter. Alcohol increases the pulsations of the heart. When that organ is under the influence of any kind of alcoholic spirit, it jumps away with increased violence to get rid of its enemy.

DR. CALVERT, in a late lecture, gives a recipe for cleaning silver articles without the troublesome and destructive use of polishing powders. The articles should be plunged for an hour in a solution made up of one gallon of water, one pound byp. sulphite of soda, eight ounces sal-ammoniac, and four ounces of aqua-ammonia or hartshorn.

THE green color of gold leaf, when seen by transmitted light, may be destroyed by subjecting the metal, extended on glass or mica, to heat, a temperature as low as that of boiling oil being sufficient if continued for several hours. When pressure is applied to such discolored gold by a convex piece of rock crystal of short radius, the green color of the transmitted ray reappears.

ORNAMENTAL GLASS.—A beautiful variety of ornamental glass has been devised by M. Pelouze: 250 parts of white sand, 100 of carbonate of soda, 50 of limestone, and 40 of bichromate of potash, are fused together. A glass is thus formed of a rich green color filled with golden spangles.

A VARIABLE star has been discovered in the constellation of the Northern Crown, and has been carefully observed at the United States Naval Observatory in Washington. The daily rate of decrease is about fourtenths of a magnitude, and it has changed from the second to about the eighth magnitude.

HEAT rarifies the air to such an extent that it can be made to occupy 5,500 times the space it did before.

WATER, when converted into steam, increases in bulk 18,000 times.

FORESTS ON THE WESTERN PRAIRIES.—It is said that in numerous localities on the prairie of Kansas, which are protected from the ravages of fire by neighboring cultivated fields, are being covered with a spontaneous growth of forest trees, chiefly oak and hickory, which in twenty years will become dense forests. The frequent fires which so often rage on the Western prairies are the sole preventive to the growth of trees, and an abundant supply of wood for all practical purposes.

THE TELEGRAPH, in Switzerland, is the property of the State. An office for the reception and transmission of dispatches is established in almost every village, and the charge is uniform—one franc, about twenty cents, for twenty-five words, or a little over one cent per word, irrespective of distance. The dispatches are printed, and the establishment, even at this low price, yields a large revenue to Government.

It is estimated that thirty tons of white paper are used daily in the manufacture of paper collars.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, August 4th, 1866.

The Money Market continues abundantly supplied with capital at the rates current for some time past, and the usual bank accommodations for acceptable business paper rule at 1@1¼ cent. per month.

Mining Stock collaterals are obtaining rather more favor, and bankers and others seem disposed to admit a more extended limit of discounts upon this description of security than for some time past. With our merchants and business men, generally, the requirement for legitimate purposes is moderate.

Receipts of treasure from domestic sources during the week amounted to \$1,100,000, and since the 1st inst. were about 500,000.

There has been no especial inquiry for bullion since the sailing of the last steamer, and gold bars are freely offered at 860@870. Silver is ruling at about par for average parcels.

Legal Tender Notes have been in better request, advancing from 71 to 73½, and closing at about 72c. bid. Gold declined in New York, on the 31st ult., to 143, since rising to 148½@149, and quotable yesterday at 149.

The Mining Share Market has shown considerable strength since Saturday last. A better feeling is discernible, and most stocks are strongly held in expectation of a further rise. The aggregate yield of leading claims last month proves to be larger than was anticipated, and from all that we can learn the probabilities favor a still greater production the ensuing fall.

We are requested to call attention to some errors which appeared in the financial column of a paper of this city a few days since. It is there stated, in speaking of the cost of materials incident to mining operations on the Comstock lode, that the 22,265 cords of wood consumed annually cost \$16 per cord, and the timber and lumber required every year—15,500,000 feet—was worth about \$40 per 1,000. As is well known, a number of lending companies, for some time past, have been furnished with wood at \$14@15 per cord, and the cost of timber has not exceeded \$28 per thousand.

Hale & Norcross has met with no sale this week, but is strongly held at full figures. The appearance of this mine is said to be most flattering, especially so in running south upon the 535-foot level. Receipts of bullion from the 1st to the 30th ult. amounted to \$139,883, from 2,718 tons of ore—an average of \$51.09 per ton.

Savage has continued to attract more attention, steadily advancing from 945 to \$1,050, then selling at \$1,065, and closing at \$1,067½. A dividend of \$50 per foot will be disbursed to the stockholders to-day, leaving some \$23,000 in the treasury of the Company. The Atchison mill was recently purchased at a cost of \$50,000, to be paid for in ten months, in installments of \$5,000 each, without interest. The capacity of this mill will be increased to 50 tons per day. During the week ending 28th ult., 812 tons of ore were extracted from the mine, and 792 tons shipped, most of which came from the 6th station. The 7th station is being opened from the old shaft. At the Curtis shaft the southwest drift is passing through the clay seam, which hounds the Hale & Norcross seam of ore to the east, and ore will probably soon be reached at that point.

Crown Point is in much better request, advancing from \$875 to \$1,000, and closing at \$1,000 asked. The main shaft has been re-timbered to the surface, and provided with new cages. Hoisting has begun. The north incline is going down slowly, but is said to "look remarkably well." During the month of July 1,400 tons of 3d class and 500 tons 2d class ore were worked at different mills.

Gould & Curry was sold at \$705, closing at about \$750, asked. Receipts of bullion from the company's mill alone for July amounted to \$125,000, being the product of some 3,300 tons of ore—an average of about \$38 per ton.

Yellow Jacket has been dealt in at enhanced rates, advancing from \$585 to \$665, and selling yesterday at \$675@690. We have no official report from the mine this week, but learn that the yield of bullion for the week ending 28th ult., exceeded \$55,000, and that the aggregate receipts for the past month will probably reach \$250,000. A dividend of at least \$50 per foot will be declared for July.

Ophir rose from \$237 to \$260, declined to \$246, and was dealt in yesterday at \$260@275. The newly discovered deposit of ore in the 8th station, can now be reached with facility. Some ore has appeared this week in the lower winze from the 9th gallery lying against the east wall and the seam widens, as drifted upon, toward the north.

Chollar-Potosi has been more active, and nearly 350 feet were sold, receding from \$180 to \$165, rallying to \$180 again, and then selling at \$180@182. In the various stations throughout this mine there has been no change whatever to note during the past week. The 2d station drift is in some 300 feet, and is still being driven to the west. A seam of quartz, 2½ feet wide has been met with, assaying \$2@3 per ton. During the week ending 28th ult., 655 tons of ore were sent to custom mills.

Belcher dropped from \$135 to \$107, rose to \$160, receded to \$140 @ \$135, and was sold yesterday at \$150@160. An assessment of \$45 per share was levied July 21st.

Imperial is dull and inactive, and small sales were made within a range of \$91@94, closing at \$93. The last clean-up of the company's mills amounted to \$27,694, making the aggregate receipts for the month of July about \$65,000. The ore from the red ledge in the Alta mine is said to be improving.

Overman rose from \$36 to \$42, declined to \$40, and sold yesterday at \$39.

Bullion was dealt in at \$39½@41½, closing at \$39.

Confidence steadily declined from \$57½ to \$42½, and sold at the close at \$41. The assessment of \$25 per share, rescinded a short time since, has been re-levied.

Sierra Nevada was sold at \$4½@3½, closing at \$3½. An assessment of \$4 per share was levied 2d inst.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday, amounted to \$295,545.

Mining Summary.

CALIFORNIA.

Alpine County—

From the Silver Mountain *Bulletin* of July 25th we clip the following items: Kohinoor rock assayed \$51.68 in gold, and \$98.52 in silver—total, \$150.20 per ton.... The Lady Eliza has been tapped lower down the mountain, and from present appearances ores will be produced therefrom within sixty days in quantities sufficient to employ a 20-stamp mill constantly.... The Balacava and the Winchester have sent ore to the Pioneer mill at Markleeville to be tested.... Others will send to San Francisco for the same purpose.

The Alpine *Miner* of same date says: The American company have drifted seventy-five feet, cutting across their ledge at a depth of twenty-five feet. The ten or twelve feet last cut is through a mass of blue-black ore, rich in copper, and containing silver and gold in large quantities for the depth. Several assays for gold and silver only, made by Dr. Waters of Markleeville, and Leopold Kuh of Virginia City, range from \$53.30 to \$128.18, in every case showing about one-third gold.... The Buckeye No. 2, in drifting in on their lode recently, struck a body of solid quartz covering the full size of the tunnel, and, it is said, are now confident of ability to supply a mill with pay ore.

The *Bulletin* of this 28th has these items: Charles Uzay, Metallurgist and Assayer, arrived in town on Wednesday evening, and will commence immediately the erection of furnaces at Whiteside's mill, for the purpose of working the ores from the George Washington lode. As the George Washington claim is not as yet developed to an extent to furnish a supply of ore to keep the mill in constant operation, Messrs. Uzoay & Kustel have made a contract with the Morning Star company for 10,000 tons of ore from their mine, at Mogul, to be worked here.

The *Miner* of same date says: Work on the George Law, near Markleeville, from the croppings of which such large results were obtained, is prosecuted vigorously. A tunnel is being run.

Amador County—

The *Ledger* of 28th July, has these items: We understand that Meader & Co. have leased the Coney mine for a stated period, with the privilege of purchasing, and that they contemplate making several improvements and alterations. Also that they have taken the Mannon Sulphuret Mill at Sutter Creek.... The Eagle mill is temporarily stopped whilst a tunnel is being cut. The last ore crushed paid largely.... The Golden Gate mine, which has always paid well, is now yielding richer rock than ever before. The main shaft is being rapidly deepened.... The Belding is yielding its rich sulphuret ores as freely as ever, and several additions have lately been made to the mill in the way of machinery for saving and working sulphurets. Five more stamps will soon be up, and other and further improvements made.... Several new shafts have been sunk and levels run, in the Pioneer, since Meader & Co. came into possession. The yield per ton is, we understand, five times more than before the present improvements were made in the reduction works.... The Italian is turning out abundance of forty dollar ore.... The Golden Eagle, Vaugh & Co., is said to be as rich, if not richer, than ever. They are crushing their rock at the Fogus mill.... The Pleasant Valley, or better known as "My Mary Ann," is now down to the depth of over sixty feet. They have on hand about forty tons of fine-looking rock.... The Anaconda, the richest ore mine in the district, is lying idle.... The Paugh Mine continues to yield large quantities of rich ore, which is worked at the Union Mill. The new shaft, connecting the extreme west end of the main level, will soon be completed. Large slabs of ore are daily taken out, "lousy" with gold.... The Kelly & Stevenson is in full blast.... The Excelsior is now down some 45 feet, and is yielding good ore. The first crushing is now being made at the Fogus mill, and promises well.

All in all, the mines of eastern Amador were never in a more flourishing condition. During the past ten days a number of gentlemen—capitalists and representatives of Eastern capital—have been making this place their headquarters, and "bobbing around" in search of favorable chances of investment. They could not have selected a better part of the State.

The *Ledger* says, in reference to the statement, that Amador is indebted to Calaveras for a portion of its gold returns, that the reverse is the case.

Calaveras County—

From the *Chronicle* of July 28th, we clip the following: Work is being steadily pushed forward on all the claims at Railroad Flat, and the prospects are very flattering. Post & Co. have a shaft sunk on their claim to the depth of forty feet. A quantity of unassorted rock taken from their lead and crushed at Harris' mill, yielded an average of \$40 per ton. Weihe & Co. are down thirty feet on their claim, and

have found rock of extraordinary richness; some of it prospecting as high as \$75 per ton. Butler & Co. have attained the depth of thirty feet, and developed a very fine lead; the rock averaging \$20 per ton. Granville & Co., whose claim is located in Two Dollar gulch, have reached the depth of thirty-five feet. Their lead is three feet wide, and the rock prospects \$45 per ton. Lady Frank & Co. have taken up and are working an extension of Butler & Co.'s lead, and the indications are that they have a valuable claim.

Gravel mining is not "played out" with us, notwithstanding the quartz excitement. Gleason, Sawyer & Co. have recently commenced running an incline tunnel in their claim near the Golden Gate. It is estimated that they will have to run six hundred feet before striking the lead. Paul & Co., the next claim below, on the same ridge, are running a bed-rock tunnel for the same lead.

The Copperopolis *Courier* of same date, says: It seems as if new impetus had been given to mining operations in Salt Springs Valley. We understand that two mills are now crushing rock from different leads, with satisfactory results. The Alban Ranch mine, under the efficient supervision of Mr. Steinberger, is said to be paying handsomely.

Colusa County—

The *Sum* of 28th July, says:—Mr. Burk of San Francisco has been engaged for some time in hauling out castings, brick, etc., for the erection of a Sulphur Refinery near Simon's Springs, where there is an almost inexhaustible supply of sulphur. We understand also that there are parties now preparing to put up copper smelting works at Ashton.

El Dorado County—

EL DORADO MINES.—The Placerville *Record* of July 14th, says:—The Pacific Mine, known by all old residents as having been exceedingly rich, and yielded great returns for the amount of work done upon it, but which for some cause has not been worked for a long time past, was a few days since purchased by Fitch, agent for a New York company, for the sum of twenty thousand dollars.

The *Polsom Telegraph* has the following:—It is confidently believed that the celebrated "blue lead" so rich and extensive in the upper part of Nevada and Placer counties, has been struck in Eldorado county, near Placerville. We saw an assay made by Palmer & Day, assayers in this place, from two hundred and fifty pounds of average cement from the claims of the Western Tunnel Company, whose claim is about two miles from Placerville, from which seventeen dollars in gold were realized.

Kern County—

The Mariposa *Free Press* gives extracts from a Kelso letter of date July 15th: The Atchinson company have made the purchase of the ledges they bargained for, from the Pi Ute company, and they are now hauling quartz to Rogers' mill in this place. They are down on the ledge thirty or forty feet, and the rock looks very well. Monkton, Sprague & Co., I understand, have made a sale of their ledges to a New York company. The Hope vein holds out as usual and is getting wider. The boys cleaned up, after grinding twenty-five hundred pounds of rock, and got nineteen and three quarter ounces of gold.

A correspondent of the *Visalia Delta*, writing from Havilah, speaks in glowing terms of the wonderful richness of the lode, known as Cherokee Dick, or the Big Indian. This lead has a shaft sunk to the depth of fifty feet. The pay rock is from fifteen to eighteen feet in width, and the glittering ore can be seen "sticking out" all through the mass.

The correspondent of the *Flag* says: In the Mammoth mine, the length of pay ledge is 1,600 feet; their lower tunnel is to 125 feet and progressing, when under the summit of the mountain, will be 500 feet from the surface. Their upper tunnel is in 365 feet, the lode is four feet wide in this tunnel, which is 125 feet right over the lower tunnel, on the same lead. This rock averages about \$40 per ton. They were working fourteen men at the mine. The Caldwell and Kern River Gold and Silver Mining Company's mill and lodes are situated about one mile above the village of Kernville, and at present are working forty men. The mill has twelve stamps with capacity for twenty. They are crushing eighteen tons of rock per day from the Sherman lode, which rock averages about forty dollars per ton.

Klamath County—

The Humboldt Bay *Journal* of July 19th, has an editorial on this county, from which we clip the following: The quartz veins near Sawyer's Bar have proven to be rich in gold; several mills for crushing quartz have been erected—only one of which, we believe, is at present in successful operation—the Black Bear, owned by Messrs. Conghlin, Dagget & Co. The gold bearing quartz section is extensive, and may be estimated as covering one-fourth of the county—the upper portion adjacent to Siskiyou.

There is a belt of from four to six miles in width running through the entire county, which gives evidence of containing the richest copper

veins on the Pacific slope. Great lumps of pure copper are picked up on the surface of the earth, and croppings of ore, known as red oxide and gray oxide, assaying 80 per cent., are found in abundance. Cinnabar and silver also exist on the Klamath river.

Mariposa County—

The *Free Press* of 28th July, has these items: Latest accounts from the Hamilton copper mining district are favorable. At the Bachman shaft they are down about seventy feet and have a vein of black oxide three feet in thickness with well defined foot and hanging walls.... On the Buchanan at the Roland shaft, at the depth of ninety-five feet, they have a vein six feet thick, black oxides and sulphurets. The ore improves in quality as they go down.... Green, Snediker & Co. are progressing finely with their shaft. They have made one shipment of ore and will soon ship a still larger quantity.... The Celeste is the name of a copper vein on Bear creek, two miles from the Corbett Ranch, now being vigorously worked, and which promises to prove rich. We have been shown some of the rock taken out at a depth of twenty feet, which looks exceedingly well. It contains gold and silver as well as copper.

Mono County—

Letter from Partzwick to Esmeralda *Union* dated July 18th, has the following: The Cornucopia company are still busy opening and developing their lode. One of the shafts is now down about one hundred and ninety feet, whilst the other four are being rapidly sunk, and have reached depths from one hundred to one hundred and fifty feet. The Kearsarge sustains its reputation. The Comanche is looking remarkably well, while the Diana is the same as ever; one of the richest silver bearing veins on this side of the mountains.

Nevada County—

The following items are from the *Gazette*:—We were shown yesterday some fine specimens of sulphuret ore taken from the northerly extension of the Banner mine. This extension is owned by Tisdale and Stiles, who have sunk a shaft to the depth of seventy feet, and the ledge varies from three to five feet in width. The shaft is about eighteen hundred feet from the Banner works.... On the 16th instant the Cold Spring company made a location of eighty claims on the ridge between Deer Creek and South Yuba river, having a front of four thousand feet, in the neighborhood of Willow Valley, and extending back north and east in the direction of Gopher Hill, five thousand and nine hundred feet. The development of the cement mines is going on hand in hand with the quartz.... The French mill has been employed night and day for several weeks past in crushing rock from the Wigham mine. The mill has only six stamps, and crushes probably about ten tons in twenty-four hours, the mine yielding sufficient rock to keep them running. We understand that the rock is now yielding well. In working the ore from this mine, the sulphurets are concentrated by ore separators, and five or six tons have already been saved. These assays from \$200 to \$500 a ton.... The machinery for the quartz mill of R. C. Black, to be erected on the ledge belonging to J. Young at Eureka, manufactured at the Nevada Foundry, was completed about a week ago, and as soon as teams can be procured will be delivered at its destination.

The Grass Valley *National* has these items: Wm. M. Lent and Jos. Clarke have affected the purchase of four-fifths of the Dromedary mine, located on Wolfe creek. The mine has been worked to the depth of three hundred feet, but has remained idle for over two years. Messrs. Lent and Clarke will now put up all the necessary machinery.... We this noon learned that Messrs. Peachy and Cronise had purchased the well-known Noramabua or Forrest Spring mine. One hundred thousand dollars is said to have been the sum paid for this mine, and we do not know of any place where that sum could have been better invested.

One hundred and fifteen sacks of ore are now lying at the Last Chance Copper mine ready for shipping, and in about ten days the number will be augmented to two hundred sacks. Mr. Delano informs us that the ore is being taken out in blocks weighing fifty pounds and upwards. The ore now at bank assays twenty-five per cent. copper.... The Sterling tunnel is now in 400 feet. Ledge four feet thick. This claim has lain idle for a period of some seven months, but work is about to be resumed in it.... One hundred and seventy-six tons of rock from the Consolidated Wisconsin and Illinois mine were crushed at Gold Hill mill last week, and yielded forty-one dollars in gold to the ton, besides a large quantity of rich and valuable sulphurets. This is the result of the present month's work.... Thomas, Powling & Co. have named their newly discovered ledge the Cape of Good Hope. Very rich specimens were recently taken from it.... The tunnel of the Oxford is now in 450 feet, at which distance the ledge was struck. The rock now being taken out shows large deposits of free gold and very rich sulphurets.... The contract for the erection of the Lucky company's mill has

been let, and the construction thereof will be immediately commenced.

A twentieth interest in the Eureka mine, near Grass Valley, was sold a few days since, as we learn, for \$43,000. This is equal to \$860,000 for the mine.

EXCELSIOR.—The *Gazette* says:—The Enterprise company are now pushing ahead the work vigorously on the mine, and the mill having been remodeled, will at once be started up again.... Parties recently down from Meadow Lake report that money is scarce in that locality, business dull, and the times have anything but a cheerful look. We are not surprised that this is the case. However rich the mines may be, too many people have gone there to speculate, or engage in outside business, for all, or any considerable portion of them to do well.

The Mountain *Messenger* has an article on "Summit City," from which we quote: Lots that four weeks ago were sold at fifteen hundred dollars, have within the past ten days been sold for less than half the sum, and buildings and lots will yet be sold for about the cost of materials and work. There are now perhaps a thousand men less in the district than three weeks since, and still there are many going away. Yet we do not conceive that this state of things exists from any failure or discouragement of mining prospects, but wholly and solely from the want of proof that the mines are more valuable than those of other localities, and from the general failure consequent to it, to give employment to miners and security for investment of money.

Placer County—

From the *Stars and Stripes* of August 1st we clip the following: We learn from James S. Stackhouse, Collector of the Third District, that a quartz ledge was discovered recently by some Mexicans, at Canada Hill in this county, about twenty-five miles above Michigan Bluff, the rock from which, taken from any portion of the ledge, will yield free gold at the rate of about one dollar per ounce. Parties went up from the Bluff to try to purchase the ledge.... The people of Auburn are going to build a quartz mill by subscription.... At the depth of 103 feet in the Civil Rights claim, near Newcastle, the ledge is twenty-two inches wide, and the rock like that of the Eureka, in Grass Valley.

The Placer *Herald* of July 28th says: The Little York is being worked day and night.... The incline of the Taylor, on Dutch Ravine, is now down 100 feet. The lead is well defined, and very regular.... On the Mallat claim they are driving the east and west drifts on the 50-foot level. In the east drift they now find decomposed rock, any of which prospects well in free gold.... Work on Millett's quartz mill, on Baltimore ravine, is progressing. The boilers have been set, and the engine is now being put up.... The shaft in the Golden Rule claim, at Horse Shoe Bar, is down forty feet.

Plumas County—

The Quincy *Union* of 21st July has these items: Jenkins & Kellogg, of Round Valley, forwarded below, one day last week, about \$3,400, the result of the first clean-up from about a week's crushing of the quartz from the Kittle ledge. The rock averaged \$14.50 per ton.... The Copper Smelting Works, at Genesee Valley, fired up one day last week, and is smelting ore from the Prince ledge, nt Taylorville.

Shasta County—

The *Courier* of the 28th says: The town of Shasta is now proven to be the center of the best mining district in the world. This is a broad assertion, but present prospects justify all we have said. * * We venture the assertion that there is paying quartz within a radius of five miles around Shasta to support and pay a population of 50,000 working men, to say nothing of the millions of dollars worth of machinery it would call into operation—all easy of access.... A shaft is being sunk to prospect the Big Central lode. The Clear Creek Ditch company's flume will be finished in a month.... The Mammoth company's lode at Quartz Hill, known as the Harrison, is prospecting beyond all precedent. One of the workmen brought into town this week a specimen which he declares is no more than a fair average of nine tons of rock now on the surface. Eight ounces of it crushed in a mortar yielded \$143. The estimated value of the prospect is \$5,500 per ton. There is no doubt in the minds of experts who have examined the rock that the nine tons now out will yield from \$18,000 to \$20,000, at the lowest possible estimate.

Sierra County—

The *Messenger* of 28th July, gives these items: The Good Hope Company, whose claim is situated just above town, have struck the ledge in their tunnel. The rock is mostly decomposed quartz, shows about three feet in width, and prospects well. The croppings show gold in abundance.... The Sailor Company's Mill cleaned up on Wednesday evening, after a short run of only six tons, the result exceeding their most sanguine expectations.... Negotiations are in progress for the

salo of the Oak Flat company's ledge to parties from San Francisco, of whom ex-Sheriff Kirkpatrick is one. The boiler for a forty-horse engine, for the Greenback claim, Alleghany, is on the ground, and the engine is on the way. Gov. Newell proposes to erect a ten-stamp mill as soon as plenty of men and money can do it.

Siskiyou County—

A company of Chinamen, on the North Fork of Greenhorn, in Siskiyou county, took out a nugget valued at \$469, last Saturday, and there was some excitement on the creek concerning its discovery.

Tuolumne County—

From the *Columbian Citizen* (late *Courier*), of July 28th, we clip these items: The Columbia Company, on Main Gulch, at the foot of Broadway, are preparing now to wash up. They have been running their sluices for nearly a month. The "Tiger boys," after a run of four or five weeks, are also preparing to wash up. This claim pays remarkably well. The Haines boys are "plowing" up, with their two hydraulics, the large flat at the foot of Broadway and Silver streets. They are also busy at work ranning up their flume through the town. Fourteen tons of rock crashed by the Mount Vernon company, last week, yielded the handsome sum of \$1,900. Messrs. Ward, Evans & Co. are taking out, this week, some exceedingly rich rock. Their lead is the old Morse lead. "Shanghai," two-and-a-half miles northeast of this city, is paying splendidly. Last week, a run of five days yielded \$1,400. The vein is two feet wide and the rock easily excavated. Two men are employed around the works. The Sonora Gold Company has, we hear, suspended operations for the present.

NEVADA.

The Virginia City *Union* says: The Kentuck mine is one of the few paying mines in Gold Hill, and is one of the least talked about. It is under the management of James Wright. This claim is being worked with excellent success. Their shaft is now down 400 feet, and as far as they can go with the machinery they have now on hand, owing to the large quantity of water. They have enough ore in sight to keep the mine running for a year.

Reese River—

The following items are from the *Reveille*: We were shown this morning a small bar of silver bullion, the first product of the mines of the Palmetto District, lying about 180 miles south of Austin. The bar weighed 111 ounces, and bore the stamped value of \$85.58, and was produced from 982 ounces from the New York ledge, which is at the rate of \$175 per ton. Five bars of bullion, obtained from ore of the North River Mine, are described as follows:—No. 1 weighed 1,025 ounces, was 850 fine, and valued at \$1,264.7; No. 2 1,187 ounces, 845 fine, value \$1,297.34; No. 3 1,047 ounces, 830 fine, value \$1,123.26; No. 4 1,067 ounces, 862 fine, value \$1,189.17; No. 5 555 ounces, 808 fine, value \$580; total weight 4,881 ounces; total value \$5,316. The bullion was produced from twelve tons of ore, which yielded the handsome average of \$443 per ton. We have been informed that the owners of the North River mine are preparing to erect hoisting machinery, with the intention of prosecuting its work systematically and steadily. Specimens of mineral brought in yesterday from the Northumberland District, yielded the following figures: first assay, \$1,765.26 of silver per ton; second assay, \$1,966. We have lying before us two beautiful specimens of mineral obtained from the Twin Ophirs of the La Platte Company, in the North Twin River District. They would be prized as gems in any cabinet of minerals. Both contain specks and laminæ of native silver.

The new Keystone mill crushed fifteen tons of quartz in eleven and a half hours. Its capacity is so much greater than that of the roasting furnaces that it remains idle a portion of the time. We saw to-day a large bar of silver bullion, the first fruits of the mines of the La Platte company, situated in the North Twin River district. The bar weighed 1,324 ounces, was 836 fine, and valued at \$1,431.38. It was obtained from ore out of the Fairmount and Twin Ophirs. The prospectors in Philadelphia district, stimulated by the grand features of the El Dorado, High Bridge, and Transylvania, have been for weeks searching for blind ledges, or ledges that do not crop above the surface. Their search has been rewarded by the discovery of ore identical in appearance with that from Transylvania. The Pioneer mill was sold on July 23d for the benefit of the lien-holders. The El Dorado ledge, in Philadelphia district, is eighteen feet thick, and bears the richest of silver ore throughout. Some samples of very fine ore were shown to us to-day by Mr. George Russell. They were obtained from the Continental claim, on the Nevada Giant ledge, in the Cortez district. The ore is of remarkably compact texture, and we think it good for \$200 a ton. The Morgan and Muncey has fairly entered the ring. Its hoisting works were set in motion yesterday.

The *Nye County News* of the 21st July says: We still continue to hear good reports from all parts of the county. The Knickerbocker mill is running steadily. In Mammoth district there is also considerable work being done, and the Mt. Vernon company is pushing work upon their claims. Work is being rushed ahead upon the Murphy company's mill, also upon the mine, and many other claims throughout the district are being opened, with gratifying results. In North Twin River district there is also considerable work doing. The La Platte company have a large force at work upon their claims, and from present appearance it is probable they will in a short time commence the erection of a mill. Any amount of good ore is brought in from Hot Creek district, and we were shown by Doctor Bowman an assay made from a ledge in which he is owner, giving a result of \$110.66, from top rock. Since our last report, the Knickerbocker mill has shipped 5,384 ounces of bullion. The shipments are steadily increasing, and we hope to see the Pioneer mill running before long, which will greatly add to the amount now shipped.

A letter to the *Calaveras Chronicle*, says: Assays have been made in Lone, of rock from Hot Creek district, reaching as high as \$3,700 per ton. Nye county is destined to rank A No. 1 in point of rich mines, and although I was the victim to a considerable amount, in an enterprise in the county soon after its settlement, I am now ready to admit what I have always entertained of the mines, that they are the mines of the State. Mark my prediction.

Emeralda—

The *Union* of July 28th, says: We are informed by a gentleman just in from Columbus that work has been commenced on the Major, Tompkins and Gibraltar ledges from which rich ore is being taken out. Since it has become known that arrangements are being made to put a mill in operation there this fall, the miners have commenced work in good earnest so that by the time the mill will be ready to start up there will be ore on hand sufficient to keep it running night and day for a long time.

The Diana company, with a little 4-stamp hand-box mill, takes out from \$1,200 to \$1,600 per week; the ore averaging in the neighborhood of \$160 per ton, and then so faulty is the manner of working it that not over two-thirds of the precious metal is saved. The proper manner of working here is by smelting process. From the Sierra Blanca company's claims, the Elmira and Crocker, ore \$300 per ton was obtained in this manner; the yield being within a fraction of three per cent. of the assay, the closest it is believed ever obtained in the State.

Pahranaagat—

The *Reveille* says: We have been shown a letter written at Pahranaagat by W. T. Nichols, in which the writer says the place is improving rapidly. Quite a number of the ledges were being worked to advantage, and Nichols thinks all they need is the means of reducing their ores to ensure an early shipment of silver.

IDAHO.

From the *Owyhee Avalanche* of July 14th, we clip the following items: The Indian "Situation" is all safe. Two hundred well equipped citizens are still in the field. Messrs. Moore & Fogus cleaned up \$13,500 during the past week. A portion of the week was spent in taking up and repairing one of the batteries in the Morning Star mill. Business is proceeding as usual. A new ledge was discovered last week on Florida Mountain, just west of Ruby. The rock looks well and is being assayed. Col. Larnabee showed us some very rich rock from the Virginia City ledge, Flint district. It shows moss silver to the naked eye. Development proves this ledge to be better than even its owners expected. The Oro Fino are sinking a new shaft to the north of the present whim shaft, for the erection of steam hoisting works—the machinery for which is on the ground. The War Eagle silver mining company have let a contract to sink a shaft on the Revenue.

A letter from Ruby City to the *Marysville Appeal*, July 27th, says: Booneville is now pretty much dilapidated. Jordan creek is principally in the hands of Chinamen. A new district is springing up about seven miles south of here, and is supposed to be rich in minerals; this locality is known as Flint district. Silver City is the most flourishing of the camps here, and is growing rapidly.

The principal mines are the Oro Fino, Poor-man, Morning Star, Hays & Ray, and Empire; most all of which are in litigation. We have seen some almost solid silver specimens from the Morning Star. The mills are stamping ore from the Oro Fino and from a place called Jacob's gulch, which is reported very rich. The mills are very small, having only five, eight and ten stamps.

MONTANA.

The *Post* of July 7th, has these items: We learn that another big bar has been made by the company now at work on Bammer Dan's bar, below this place. (Virginia City). Our informant tells us that the company cleaned up

\$2,000 for one week's run. They have opened their ground properly and work it with hydraulics. On Wednesday last, a train of wagons arrived in town laden with machinery for the Scranton gold and silver mining company. The Montana hydraulic mining company, on Nugget gulch and Wisconsin creek, have done a large amount of work and are about ready to take out bushels of money. Everything looks encouragingly for hydraulic mining. We have seen some very rich specimen of quartz rock from lodes discovered during the week, in Summit district. One of the lodes is sixteen and a half feet in width. We have seen, during the past week, several beautiful rings, with settings obtained from the Garnet lode, at Summit. This stone is much richer in color than the foreign garnet, and bears a close resemblance to the ballas ruby. When set with pearls, it is very beautiful. We learn that the mines below town, on Alder gulch, have been paying better, for the past week, than for some time before. We are happy to say that the prospectors for quartz are meeting with good success in their labors, all over the Territory. Discoveries are being daily made in almost every district. Pipestone is among the leading localities; but in Summit district, in the country lying north of Alder gulch, not yet much explored; at Silver Bow, around McClellan, Confederate, New York, Big Bear, Deer Lodge, the Missouri, Edgerton and divers other places, quartz is being struck by all the old hands, and frequently by inexperienced gold seekers. On the divide between Oro Fino and Lamp gulches, in Edgerton, a fine lode, called the Organic, has been located. The ore closely resembles the Whitlatch, in Owyhee Park.

Pipestone correspondent of same paper says: The Geneva mill is running day and night on \$35 rock. The Lion prospects from the grass roots, \$800 per ton. The Mammoth lode is the pride and boast of Pipestone. The extensions on this lode are numerous and well defined—among them are the Buckeye, Keystone, Overland, Rothschild and Mammoth No. 2. Extensions on the "Bully Girl" lode are in great demand.

Letter from Wisconsin creek to same, says: Reports from Bevin's gulch are flattering; large amounts of money are being taken out there this season; Mr. William Fern is taking out at the rate of \$330 per day to the five hands. Young Bros. are also taking out good pay from their ground. In fact, all the miners feel well, and have money in their pockets. The bed rock lumes are paying institutions. Messrs. Ramsey, Turner & Co., are taking out from theirs on an average of an ounce per day to the hand; some at the upper part of the gulch are doing still better. Huffaker's dry gulch also pays well; a nugget weighing \$144 was taken out of it lately.

Blackfoot letter says: Very fine prospects have been found at the junction of Mountain Meadow creek and Allen's Fork of Little Blackfoot. The mines on Carpenter's bar and Prairie gulch are fully up to the expectations of their lucky owners. I have heard of no extraordinary rich runs being made, like they have had on McClellan's; but what is better, the claims pay very regularly—some of them from two to four ounces to the man.

Letter from Park City, says: New lodes of great value are continually found. The Backhorn shows a good wide vein of quartz, which prospects largely in gold. The Whitney lode is ten feet in width, and prospects to the tune of \$1,400 to the ton. This is beautifully located in a dense growth of timber, and near a large stream of water. The Young America has a crevice of over eight feet in width, and the quartz shows gold in nearly every piece. Large amounts of money are being taken out at Silver Bow.

The *Radiator* of June 30th, has a letter from Bear City, Deer Lodge county, from which we clip the following: All is life here. Preparations for mining, and mining already begun, continue to increase. In a number of claims which have been worked some time, better pay than ever is now taken out, while some claims lately prospected in the lower part of the lower district, within about two miles of the Hellgate, are reported rich.

COLORADO.

From the *Journal* of July 16th, we clip these items: In Georgetown and Argentine districts, there are some ten or twelve enterprises now being prosecuted by Eastern capital. The smelters are getting along rapidly and have high hopes, and the district is constantly extending. The Keith mill started day before yesterday, and will doubtless run steady in future. Mr. Du Bois is pushing on the completion of his mill. We hear that the Sierra Madre crushing and dressing works started up yesterday. The latter are a fac simile of those in the Hartz Mountains, where the art has been carried to absolute perfection. There is a good time coming. Merchandise continues to arrive in large quantities, including iron, steel, and mining supplies. Miners contract to sink shafts and run adits for less than

half what they would a year ago, and make wages. Everybody is mining instead of building huge mills. The Keith process and smelting are growing in favor. The new silver districts are being developed. The Chicago company are putting in foundations for two large mills. Mr. Fields is at work on the Champion lode, in Trail Run. Galch mining at Buckskin is looking up. A party on Beaver creek are taking out \$50 per day to the hand. They have been working four years with indifferent success. In the Etna lode, two men have contracted to sink the shaft, five by eight feet in size, twenty-five feet for \$18 a foot. Since, they have taken out at least twelve tons of ore. Some of this has been sold to Lyon & Co., who dressed about 9,000 pounds gross, to 4,000 of head ore for which they pay \$50 a ton. This, the owners of the lode inform us, more than twice pays present expenses.

The *Register* says: Capt. Sanderson who is just in from Pera district, on one of the northern branches of the Snake, brings the most encouraging reports. He has laid on our table some elegant specimens of argentiferous galena. He has six men at work opening mines. One of these mines has a crevice ten feet wide, and some even wider. They are very rich in silver. Work will not cease with winter, but will be continued without cessation. His company is acting wisely. They do not propose to erect machinery or furnaces until they have ores out.

The *Denver News* of July 11th, says of the Bear River mines: But little prospecting has been done, as the company of three persons who worked there for a little while last season were in constant fear of Indians. Five gold bearing galches were discovered. The metal is of that variety termed "shot gold" by miners. One shaft nine feet deep has been sunk without reaching the bed-rock, the dirt yielding a good prospect from the grass roots down. Those acquainted with the mines feel very confident that, from the already discovered indications, the mines will pay \$15 per day for each hand employed. Nothing is known of the quartz lodes of the Bear River country, as there has been no prospecting for them yet done.

WM. H. KEITH & CO., Chemists and Apothecaries,

PROPRIETORS AND MANUFACTURERS OF

WM. H. KEITH & CO.'S WINE OF PEPSINE, OR RENNET WINE, a new and effective remedy for indigestion, gastralgia, etc. WM. H. KEITH & CO.'S GLUCOCOLIN, a new and valuable compound of Cod Liver Oil, put up in glass jars. WM. H. KEITH & CO.'S LEMON APERIENT, or Purgative Lemonade, a pleasant, cooling and active purgative, or mild laxative, as required. WM. H. KEITH & CO.'S SAPONACEOUS TOOTH POWDER, DEYNE'S PITCH LOZENGES, for the cure of coughs and colds. WM. H. KEITH & CO.'S Effervescent Tonic Wine. WM. H. Keith & Co.'s Granular Effervescent Citrate of Magnesia. WM. H. Keith & Co.'s Rosemary and Castor Oil Hair Invigorator.

WM. H. KEITH & CO. being in frequent communication with Eastern and European markets, are continually renewing their stock of Pure Drugs, Rare Chemicals, Fancy Goods, and Toilet Articles, Pure Oils, etc. They also give special attention to replenishing ship medicine chests. Also, just received, a large and well-selected invoice of HERNSTEIN'S CELEBRATED INSTRUMENTS, consisting in part of Amputating and Obstetric Cases, Pocket Cases, etc. Physicians and others at a distance ordering goods from us, can depend upon having their orders filled with the same regard to equality and price, as though obtained in person, and we give particular attention to packing and forwarding the same.

BROWN & BEADLE,

Offer their services to

INVENTORS AND THEIR ASSIGNEES,

—AS—

PATENT SOLICITORS.

They will make Preliminary Examinations in the Patent Office, with a view to the ascertainment of the novelty of an invention that may be submitted to them for that purpose; will prepare the necessary papers for those who wish to make Applications for

Patents for their Inventions,

—OR FOR—

EXTENSIONS OR REISSUES OF PATENTS

Already granted; will act as Attorneys in presenting Applications at the Patent Office, and in managing them to a final issue; will draw up Assignments; will examine into the condition of Rejected Applications when desired to do so, and undertake the prosecution of such as may be considered patentable, and do whatever else is usually done by Patent Solicitors.

Address, P. O. Box 267, Washington, D. C. 7v12-3m

It tells us truly the Minute, Hour, Day of the Week and Day of the Month.

HORTON'S PATENT CALENDAR CLOCK!

MANUFACTURED BY THE

ITHACA CALENDAR CLOCK COMPANY,

Ithaca, N. Y., and for sale by

W. J. EGBERT, Agent,

At Job M. SEAMAN & Co's, 631 WASHINGTON STREET, San Francisco.

THIS TIME PIECE costs but a trifle more than any other good clock, and is just the article for every well-regulated business house, office, saloon, or, in fact, any place where a fine, perfect time-keeper is duly appreciated. The Clock has two dials, the first being the same as an ordinary clock; the second has but one pointer, and shows the day of the week, the month and day of the month. It is arranged to mark the days in leap years with equal regularity. It is an eight-day piece, and runs from year to year without change. It can be examined at the Office of the Mining and Scientific Press.

SUBSCRIBERS who do not receive the MINING AND SCIENTIFIC PRESS in due time, are requested to inform the publishers.

Mining and Scientific Press.

W. B. EWER,.....SENIOR EDITOR.

C. W. M. SMITH,.....W. B. EWER,.....A. T. DEWEY.
DEWEY & CO., Publishers.

Office—No. 505 Clay street, corner of Sansome, 2d floor.

Terms of Subscription:

One copy, per annum, in advance,.....\$5 00
One copy, six months, in advance,.....3 00
For sale by Carriers and Newsdealers.—C**Payment in Advance.**—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.**Favorable to Inventors.**—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the *MINING AND SCIENTIFIC PRESS*, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.**Mr. A. C. Knox**, is our fully authorized Traveling Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.
SAN FRANCISCO, Jan 11th, 1866.**Mr. I. N. Hudson**, is authorized to solicit subscriptions, advertising, etc., for the *MINING AND SCIENTIFIC PRESS*, in San Francisco, and to receipt for the same.**It is impossible** for editors to know all the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

San Francisco:

Saturday Morning, Aug. 4; 1866.

SUPERIORITY OF CALIFORNIA HOSE.—An interesting test of the comparative merits of Eastern and California-made hose, took place on Monday last, at the trial of the new steam fire-engine. Samples of 200 feet each of hose from two Eastern manufactories were first taken, and subsequently samples of 100 feet each of California-made hose—the one from the establishment of M. M. Cook & Son, the other from that of J. J. Fulton. The engine first displayed her splendid power by playing four streams at once, fairly deluging the streets with water. After this the different samples of hose were taken up, with the following result: The first lot of Eastern hose bursted under a pressure of 180 pounds to the square inch; the second lot of Eastern hose gave way at 205 pounds pressure. The California-made hose was then brought on. Mr. J. J. Fulton's reached a pressure of 215 pounds, without weakening, when the pressure was removed without allowing it to reach its bursting point. The hose of M. M. Cook & Son was then produced, after which the maximum test was tried, the hose reaching a pressure of 225 pounds before bursting. The excitement of the trial up to this point was very great, and the puffing monster tugged away so hard at the stubborn hose, that the crowd began to stand back as if fearful lest the boiler should burst sooner than the hose. The result of this trial must be exceedingly gratifying to our California manufacturers, who have now proven, by repeated trials, that they can make a hose altogether superior to the best imported article. It should be stated that the California hose was manufactured of California-made leather. Mr. Cook & Son are now filling orders for hydraulic hose from various parts of the State, experience having proven that leather is cheaper than canvas, under most circumstances.

Mr. Fulton's hose was made by Mr. Henry L. Zepf, at the Sixth street tannery, of which Mr. Fulton is proprietor. The new fire engine, by which these trials were made, carries 160 lbs. of steam to the square inch, and exerts a water pressure of 260 pounds.

MAP OF THE SEAT OF WAR.—A. Gensoul, at the Pacific Map Depot, 511 Montgomery street, has published a very correct and useful "Map of the Seat of War in Europe," upon which the tracks of the great armies now moving over the political chess board of Europe can be distinctly traced. This publication is both useful and timely, and should be in the possession of every person who would read, understandingly, the great events now transpiring in that portion of the world.

The oldest house in the United States now standing as it was originally built, is the Rev. Dr. Whitefield's, at Guilford, Connecticut. It was built in 1639.

THE NON-INTERMENT CASE.

The papers of this city during the past week have had considerable to say about a case of non-interment, wherein Mr. T. Cowing, of 323 First street, has seen fit to place the remains of his wife, inclosed in an air-tight casket, in a vault in the rear portion of the hasement of his premises. It appears that the wife died about two years and a half ago, and that about six weeks since the gentleman, for the first time, removed the wooden panel over the glass of the casket, and to his surprise found the remains almost as perfect as when first placed there. The flesh upon the face was plump, as in life; the eyes quite natural, having merely sunk back into their sockets; the hair adhered apparently as firmly to the scalp as in life; the skin, however, had assumed a tawny hue, and the body appeared somewhat mummified, but without the dried and shriveled appearance usually attending such preservation; the flesh is moist, and yielding to the slightest pressure; it is also elastic, an indentation disappearing almost as quickly as in the living body. Recollecting that some extraordinary circumstances attended his wife's decease, he called in the aid of some medical parties, had the remains more carefully examined, and a portion of the stomach taken out for analysis. Dr. Lanzweert, who has had large experience as a chemist, in *post mortem* examinations, was subsequently called in, the body again examined, and portions of the liver, kidneys, and other organs removed for further examinations, which are now in progress.

Our object in the present notice is simply to call attention to the scientific interest attached to the case, without any reference to the truth of the various reports which have been circulated with regard to the affair in the newspapers.

We called at the premises yesterday and examined the corpse. Its preservation is certainly very remarkable, especially as no embalming process has been employed, as has been erroneously stated. For the furtherance of science, Mr. Cowing allowed a photograph to be taken of the face, to preserve, so far as possible, its exact appearance at the present time.

After the first incision had been made by the gentlemen first called, the fluids of the body appear to have escaped, and in the preparations for the second incision, this fluid was removed. The "hose washings," of which mention has been made in the daily papers, was the removal of a portion of this fluid from the floor of an open room in the basement. The fluid, at the time of removal, was, of course, somewhat offensive. At the time of our visit, yesterday, we perceived no unpleasant odor, further than that which would be noticed from a body just placed in a damp tomb. The presence of the body certainly could not have been suspected by any one standing near the closed door of the vault.

The party having the body in his possession has been complained of under Sec. 6, Chap. 3, Order 677, for allowing his premises to become nauseous, foul and offensive, and prejudicial to public health and comfort. The case came up yesterday, and was postponed until to-day, with the understanding that the body would in the meantime be removed to a proper vault in the cemetery. The cause of justice and science having been fully satisfied, the request of the Court will be complied with.

This is one of the most singular cases of remarkable preservation of bodily tissue on record. We append two or three similar cases, which have been recorded in the annals of science:

Francis Miron, a descendant from the Miron, who were successively physicians to the Kings of France, from Charles VIII to Henry III, died in 1609, and placed in a hermetically closed casket. His tomb was recently opened, and his body found in an admirable state of preservation.

The tomb of Henry IV, of France, was opened in 1782, and his body found in such a good state of preservation that his features were perfectly recognizable.

The coffin containing the remains of Gusta-

vus III, of Sweden, was recently opened, and the face of the deceased was found to be in a perfect state of preservation, although his body had fallen into decay.

There are numerous other instances of similar preservation on record, to which we cannot now refer. The causes which produced such preservation have never been pointed out. Efforts are being made in the present case, in this city, to ascertain the cause. Should any discoveries in that direction be made, we shall not fail to record the result.

A NON-RECOIL GUN—A NEW PRINCIPLE IN EXPLOSIONS.

A Mr. Harding has been making experiments in England, with open steel tubes, in which he inserts a charge of gunpowder, backed by a felt wad, and a short distance in the rear of that another felt wad is introduced, leaving a considerable air space between the two wads. The powder is then placed upon the top of the first wad, and a ball in immediate contact with the charge. The charge is then ignited in the usual manner, and the propulsive effect is said to be equal to that of a gun with a breech, while the wads at the rear end are torn into lint. The tube has no recoil.

These are the facts, in brief, in relation to this experiment, which, if correctly stated, involve a principle in the resistance of gases hitherto entirely unknown. The genuineness of these experiments, and the accuracy of the facts as reported, are credited by highly respectable journals on both sides of the Atlantic. We are not advised, however, whether they have been verified by any other party than the one which originally announced them.

Taking it for granted that the experiments are genuine, it is interesting to inquire into the philosophy of this new principle in gases. The *Scientific American* puts forth the following theory:

Between the charge and the ball there is no inclosed air space, but between the charge and the end wad there is. The resistance of the end wad must be equal, or nearly so, to the force exerted upon the projectile, yet one presents but a slight mechanical obstruction, while the other has the resistance of gravity and the column of air between it and the muzzle of the gun.

In commenting upon this experiment, the law relating to the transmission of sound in waves forces itself upon our attention, but does not seem to explain satisfactorily the facts involved in these trials. The only solution which seems at all promising is that of the wedging or transverse jamming of the particles of compressed air between the two wads. It is known that a gun barrel can be burst by a slight obstruction placed in the muzzle, confining the air above the projectile and charge. But in this case the fracture is not always toward the muzzle, where the greatest compression would be likely to occur, but at the breech, the strongest part. We can account for this only on the supposition that the temporary obstruction at the muzzle compels the particles of the explosive gas to force themselves upon those immediately in front, thus producing a strain upon the walls of the tube.

In the case of an open breech, temporarily closed by wads inclosing an air space, the air thus confined is compressed, and finding no immediate exit or release, we may consider the globular particles of the air to be forced into wedged-shaped or cone-like forms, thus pressing laterally against the sides of the tube, and forming for an instant a diaphragm of resistance as a substitute for the solid breech. It is well known that waves of sound can be propelled only at the rate of 1,100 feet per second, while the velocity of a ball propelled from a gun by an explosive is about 1,600 feet per second. There is, therefore, a loss of time between the movement of the ball and that of the resisting wads. In other words, the compressed atmosphere confined between the two wads behind the charge, does not have time to resist or recover from the sudden compression until the projectile is driven from the gun.

The following law with the regard to the flowing of angular fragments like sand, may render more clear the above explanation of the *Scientific American*, with regard to the compression of the particles of air into angular shapes, which, in their normal condition, are supposed to be round:—When a perpendicular tube is filled with sand, very little of the weight is sustained by the bottom of the tube; only so much, indeed, as would equal the weight of

a cone of sand, standing on the bottom of that tube. Nearly the whole weight of the column is supported by the walls of the tube. If a tube an inch or so in diameter be filled for about six inches or more with sand, and laid horizontally on a table, all attempts to push the sand out of the tube, by a stick of nearly the same diameter, will fail, on account of the large amount of pressure which will be brought to bear on the sides, by the wedging of the irregular particles of sand. It is probably in this manner that the particles of air, changed from their globular to an angular shape, are made to press against the sides of the gun-barrel with such force as to supply, for an instant, a breech to the same.

CONTRIBUTED FOR OUR CABINET.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

DR. R. A. COCHRAN, of Downieville, Sierra county, sends us a very fine collection of specimens from some of the representative mines of that county. We observe, among the number, the Sailor Company, a new discovery elsewhere noticed; the Sierra Buttes Company, one of the earliest and most important quartz developments in that part of the State; the Oak Flat, recently sold for \$40,000 (specimen showing coarse gold, and very much resembling the rich quartz of the Eureka and other deep mines in Grass Valley); the Primrose, a brownish colored friable quartz, stained with green carbonate of copper, carrying iron pyrites rich in gold, and free gold in the quartz; the Wheeler ledge, represented by a rich specimen of partially decomposed sulphurets, showing gold all through it; the Fac Simile, so much resembling the Wheeler that we are inclined to think it took its name from that resemblance (the sulphurets of this mine are said to be worth \$1,500 to the ton—the samples before us are worth five times that amount), and the Good Hope, which, though it does not show any free gold, gives great hope of a most reliable mine, well charged with gold bearing sulphurets. The entire collection certainly presents a most encouraging evidence of great value in the quartz mines of Sierra county.

WILL S. GREEN, sends a number of copper specimens from Colusa county, showing yellow sulphurets of copper. The percentage of sulphurets is small, but as the samples were taken from near the surface, they are quite sufficient to indicate a good supply of valuable mineral in depth. The character of the sulphurets is exceedingly good, and when found in a concentrated form, will assay as high as any similar ore in the State.

C. ANDERSON sends us several specimens of iron pyrites, almost entirely free from quartz, but interstratified with galena. They are from the Swedenborg mine, West Point, Calaveras county. We have no information as to the value of these sulphurets; but should judge from their appearance that they must contain a large amount of gold.

J. B. BACCHUS, Jr., has sent a specimen of copper ore from Capparum, Red Cove district, Klamath county. The specimen is made up of copper pyrites, red oxide, green carbonate and native copper—exceedingly rich.

WM. R. BRANSHAW contributes a lot of opals from the famous opal mine, on Stockton Ridge, near Mokelumne Hill. They come to us embedded in their enclosing earth, a trachyte of sedimentary formation.

Mons. NEVIN contributes a specimen of brown silicious rock, seamed with ngate.

WM. SHERRY sends a box of specimens from Indian gulch, Mariposa county, mostly copper and copper "indications." He also sends a specimen of tremolite, of a yellowish-white color, with radiated needle-form crystals. This mineral is composed of silica, magnesia and lime, in about the proportions of 60, 25 and 13, with traces of iron, manganese and aluminum. The Nos. with which these specimens were marked became detached, from being loosely packed.

NEW BOOKS.

GEOLOGICAL SURVEY OF CALIFORNIA.—Mining Statistics, No. 1. Quartz Mines and Mills between the Merced and Stanislaus Rivers.

We have received, under the above title, the first sixteen pages of a tabular statement of the condition of the auriferous quartz mines of California, compiled by A. Remond, of the State Geological Survey, and published under the direction of J. D. Whitney, the State Geologist. The pages before us are the results of an examination of seventy-seven gold mining and sixty-five quartz mills, situated within the region designated, all of which were visited by Mr. Remond, during the months of August to November, 1865. Of the seventy-four mines, fifty-six were being worked at the time; and of the sixty-five mills, twenty-three were running. The mines are distributed through the different kinds of rock as follows:

In Granitic.....	23
In Mica Slate.....	23
Partly in Granitic and partly in Mica Slate.....	6
In Clay Slate.....	8
In the Green Porphyritic Schists.....	3
Along the Great Quartz Vein.....	20

The facts published in the statement before us, with regard to each mine, are as follows: Name of the mine, location, date of visit, whether worked, inclosing rock of the vein, strike, dip, average width, veinstone, character of sulphurets present, yield of ore per ton, cost of extraction, cost of transportation to the mill, cost of treatment at the mill. With regard to the mills, the following statistics are given: Location, whether running, when erected, cost, power employed, number of stamps, kind of amalgamating machinery, cost of roads or trails, cost of flumes and ditches.

Each of the above items are collected so far as possible. These statistics, when completed for the entire State, will be very valuable, and the Survey could scarcely have placed this portion of the work in better hands than those of Mr. Remond.

NOTICE OF GEOLOGICAL EXPLORATIONS IN NORTHERN MEXICO, made during the years 1863-'65. By A. Remond, San Francisco.

The above paper has been compiled for publication by Professor Whitney, of the California Geological Survey, from notes taken by Mr. Remond, and was presented to the California Academy of Natural Sciences, at one of their late meetings, in whose published proceedings it now appears. These "notes" are among the most valuable and reliable which have yet appeared with regard to the interesting mineral region of Northern Mexico. They comprise, in a concise form, a brief synopsis of the topography and general geology of the region, with a tabular statement, showing the position and general characteristics of fifty-seven of the principal mines.

DR. MACGOWAN.—It is known to many of our citizens that Dr. Macgown, Commissioner of the East India Telegraph Co., a company organized for the purpose of opening telegraphic communication between the principal ports of China and Japan, and with the view of eventually connecting that part of the world with the great Russian telegraphic enterprise, is now with his family enjoining for a short time to this city, previous to his departure for China. At a meeting of the Board of Supervisors, on Monday evening last, the Doctor was invited to address that body at their rooms on Monday evening next. Dr. Macgown, during a residence of nearly twenty years in China and Japan, has gathered a great number of curious and scientific facts regarding those interesting countries, by narrating which he has won the regard of numerous learned societies and appreciative audiences in the United States and England. The subject which he proposes to speak of before the City Fathers is the importance of the industrial and scientific exploration, which he is about to undertake, to the commercial interests of the Pacific States. We trust the Doctor, after addressing the "Fathers" in these important matters, will extend the sphere of his instructions to the great mass of the people, through a call from either the Mercantile Library Association or the Mechanics' Institute.

A LITTLE BOY recently died from playfully piling stones on his stomach while lying down.

NEW PATENTS.

Recently issued from the United States Patent Office, and of special interest to residents on this coast.

DRILLING MACHINE FOR WELLS.—M. E. Abbott, Summit Hill, Pa.: I claim, 1st, the arrangement of devices herein described for imparting to the drill rod a movement in a vertical plane, the same consisting in securing it within the frame or cross-bar, moving in suitable vertical guide-rods or bars, and connected with the engine handle, in any proper manner. 2d, Revolving the drill through the vertical movement of the same by means of a sliding plate, moving in and between parallel inclined guides, and provided with a spring pawl, engaging with the ratchet-wheel of the frame, arranged and operating in the manner described. 3d, The combination of jaws, and bent arms, arranged and operating with a rod, in the manner and for the purpose specified. 4th, The combination of the jaws and lever frame, arranged and operating with a rod, in the manner and for the purpose specified. 5th, In the described combination with the drill-rod, and the beam, for operating the same, I claim the crank-arms, rods, and adjustable tappets, arranged and employed substantially as set forth, to regulate the stroke of the drill.

APPARATUS FOR INDUCING THE FLOW OF OIL FROM WELLS.—John B. Christian, Mount Carroll, Illinois: I claim, 1st, The combination of a flanged pipe, with a slotted double hollow cylinder, and another cylinder, as arranged in relation to each other, substantially as and for the purpose specified. 2d, Lowering the pipe or its equivalent, and securing it firmly in its place in the well, by means of the tube, with its circular base, in combination with the rod, substantially as set forth.

OIL CRUSHER.—Joseph Fowler, Rahway, N. J.: I claim, 1st, The crank-shaft and connecting rods, in combination with jaws, when the parts are arranged and operating as and for the purposes specified. 2d, In combination with the jaws, I claim the adjustable side pieces and screws, for the purposes and as set forth.

COLLECTING THE LIGHT OILS FROM OIL WELLS. John Johnson, Saco, Maine. Ante-dated May 10, 1866: I claim, 1st, The separating and gathering at the wells a new article of commerce, viz.: The light condensable vapors which rise with petroleum, and which may be pumped up under any suitable seal and condensed, substantially as herein set forth. 2d, Volatilizing and condensing the condensable products from petroleum at the wells, by forcing air or gases through petroleum for the purpose herein set forth substantially as specified.

TOOL FOR REMOVING SCALE IN BOILER TUBES. Philip C. Rowe, Boston, Mass.: I claim, 1st, In combination with a cutter-head, a tubular screw, with an internal screw, arranged to operate substantially as described. 2d, In combination with the above, I claim supporting the nut for the screw, the turn-buckle clamping device, substantially as set forth. 3d, The construction and arrangement of the parts described, by which the cutters of the head are adjusted, substantially as specified.

TREATING OILS.—H. K. Taylor and D. M. Graham, Cleveland, Ohio: We claim, 1st, The treatment of petroleum and other similar hydrocarbons by means of nascent, hydrochloric acids, chlorine, fluorine, or other equivalent chemical re-agent, so as to change the constitution of the oil and purify it, substantially as herein described. 2d, The use of sulphuric acid, nitric acid, or salts containing these, or either of them, when used in combination with other materials, such as herein described, or their equivalents, for the purpose of treating petroleum or other hydrocarbons, as described.

ROCK DRILL.—Owen G. Warren, New York City: I claim loading the shaft with the collar weight to render unnecessary a high lift and for rapid boring.

PROCESS OF REFINING HYDROCARBON OILS. Philip Weinsberger, Pittsburg, Pa.: I claim the above described process of purifying distilled petroleum or other liquid hydrocarbons, without the aid of any alkalis, by means and with the use of water at 212° Fahr., or at approximate degrees of temperature, in the manner specified.

ROCK DRILLING MACHINE.—Walter Hyde, assignor to Mrs. Deborah A. Bailou, New York City: I claim, 1st, An eccentric gear, in combination with a platform, handle and hammer, constructed and operating substantially as and for the purpose specified. 2d, The slot, E, in the bracket, F, in combination with the eccentric gear and hammer, constructed and operating substantially as and for the purpose set forth. 3d, The curved rod, G, and double-cranks, H, in combination with the eccentric gear, and hammer, constructed and operating substantially as and for the purpose described.

PATENTS can be obtained for citizens on this Coast through the MINING AND SCIENTIFIC PRESS PATENT AGENCY, in one-half the time it takes to operate through Eastern agents. From our familiarity with the subject of most California inventions, and the benefit arising from personal explanations, we are prepared to present claims with greater accuracy than could reasonably be expected of distant agents. DEWEY & CO., Patent Agents, 505 Clay street, San Francisco.

LIST OF OFFICERS OF CORPORATIONS AND MINING COMPANIES.

[PUBLISHED IN THE FIRST ISSUE OF EACH MONTH.]

[Below we give the date of recent meetings held in this city, and the names of officers chosen or appointed. Every bona fide company is invited to send us the result of their election, to be thus put on record, gratuitously, with any other facts of general interest.]

ASSURANCE M. Co.—July 9th. Trustees: O. C. Wheeler, Geo. R. Spinney, C. L. Chrr, C. W. M. Smith, J. A. Eaton. President, O. C. Wheeler; Vice President, Geo. R. Spinney; Secretary, H. H. Russell; Treasurer, J. A. Eaton.

MELONES AND STANISLAUS G. & S. M. Co.—July 10th. Trustees: Robert Sherwood, R. Bayerque, G. K. Stevenot, J. G. Klumpke, and P. M. M. President, R. Sherwood; Secretary, Geo. Congdon.

CHOLLAR-POKOSI M. Co.—July 9th. Trustees: A. K. P. Harmon, Wm. E. Barron, A. C. Peachy, B. F. Sherwood, Chms. Hosmer, M. C. Hilley, Lloyd Tevis. President, A. K. P. Harmon; Secretary, W. T. Dean; Treasurer, Wm. C. Rolston; Superintendant, Hrvsy Beckwith.

TUNNELING G. & S. M. Co.—July 31. Trustees: Camila Martin, F. O. Wegeuer, Chas. Piada, P. G. Vennrd, Ottotrain Gori, H. Huguet, R. Wegeuer. President, Camila Martin; Secretary and Treasurer, R. Wegeuer; Superintendent, H. Huguet.

RECENT INCORPORATIONS.

CHALK MOUNTAIN BLUE GRAVEL Co.—Nevada county. Capital stock, \$600,000; 6,000 shares; \$100 per share. Trustees: J. L. Sanford, A. C. Hendley, E. C. McComb, Isaac Swain, and A. J. Downer. July 13.

CREBUS S. M. Co.—Inyo county. Capital stock, \$250,000; 500 shares; \$500 per share. Trustees: Almarin B. Paul, J. H. Atkinson and John Gillig. July 31.

ENTERPRISE G. & S. M. Co.—Meadow Lake, Nevada county. Capital stock, \$1,500,000; 6,000 shares; \$250 per share. Trustees: A. D. Land, J. De Bell, E. B. Mott, Jr., C. W. Young, and T. B. Storer. July 10.

FARMERS' FLOURING MILL ASSOCIATION.—City of San Francisco. Capital stock, \$75,000; number of shares, 750; \$100 per share. Trustees: S. W. Boring, H. N. Tierner, and J. B. Houghton. July 2.

PENINSULA PLANTATION AND HOMESTEAD ASSOCIATION.—Lower California and Mexico. Capital stock, \$48,000; 3,000 shares. Directors: Wm. M. Pierson, Wm. Corcoran, Jos. Healy, John H. O'Brien, John McNamara, E. Nuoan, and A. Lamott. July 3.

SOUTH POINT WAREHOUSE COMPANY.—City of San Francisco. Capital stock, \$200,000; 200 shares; \$1,000 per share. Trustees: S. P. Dewey, Henry Peirce, C. S. Hutchinson, Samuel Tyler, and Edwin Harris. July 9.

THE LEZ AND MONTEZUMA M. Co.—Kearsarge district. Capital stock, \$360,000; 3,600 shares; \$100 per share. Trustees: A. B. Paul, Irwin McDowell, and R. W. Kirkham. July 21.

NEW COUNTY.—The County of Inyo, established by the last Legislature, has just been organized and the county seat established, by a vote of the people at Independence, ten miles from Kearsarge. This county was taken off from Tulare and Mono counties by the last Legislature, and includes the whole of Owen's River Valley and Walker's Pass. The western boundary is the summit of the Sierra, and the eastern, the dividing line between Nevada and California; it is bounded on the south by San Bernardino County. We understand the citizens of the county are desirous of having a newspaper established there, and will give material aid to the enterprise, if any suitable person will undertake the same.

THE NEW MERCANTILE LIBRARY BUILDING, which will soon be erected on the lot next below Calvary Church, on Bush street, will be one of the finest library buildings in the United States. It will be four stories high, and of a similar style of architecture to the Cosmopolitan hotel.

STOCK CERTIFICATES, STOCK TRANSFER JOURNALS, STOCK LEDGERS, ASSESSMENT RECEIPTS,

And all other Blanks, Blank Books, etc., required by Mining and other Corporations, kept on hand or printed to order on short notice, at moderate prices, at the office of the MINING AND SCIENTIFIC PRESS.

SEND US WORD.—If any subscriber to this journal fails to receive the same regularly and promptly, they will confer a favor by informing us at once.

New Mining Law Queries.

EDITORS PRESS:—Please answer the following queries:

1st. Am I right in supposing that a patent, once obtained from the Government, for mining claims protects me from forfeiture of that ground, by abandonment or by failure to comply with local laws after the patent is received; or in other words, will not, in all probability, a patent for mining grounds give me as absolute and irrevocable title as is conferred by the U. S. Patent for agricultural lands?

2d. Supposing a ledge on a west side hill to run north and south, facing west, and dipping east, and I locate 200 feet on said ledge, and make my north and south boundary lines at right angles with the face or croppings of the ledge, and claim all the dips, angles and spurs, without designating an eastern boundary; will not my location be in conformity with section 2d of the new law, and will not the "laternal dip" which I am allowed to follow by said law, be confined between the north and south lines, drawn at right angles, as mentioned above?

3d. Is not the writer in the Marysville Appeal laboring under misapprehensions of what is strictly termed "square claims," and would not the boundaries suggested in query 2d, be sufficiently square to accommodate the working of his system of chimneys?

Yours, truly, B. HONEST.

Answer to queries, and further discussion of the law may be expected in our next.

It is filled with reliable, useful and interesting matter and to our miners who wish to understand the theoretical, as well as the practical part of their business, the MINING PRESS will be found an invaluable aid.—[Nye County News]

WHO KNOWS HOW TO BE RICH?—The Nation makes the following reply to this question, which contains a great deal of truth:

"Plenty of people know how to get money, but not very many know what is best to do with it. To be rich, properly, is indeed a fine art. It requires culture, imagination, and character. A man who should practice this art with success would be one of the greatest benefactors of his time. He might win a pure fame and leave an enduring example. To be rich is to be able to be magnanimous; to conceive and to execute large, splendid, and permanent designs. It is to be at ease and set others at ease. It is only the rich man who does not know how to be rich that finds it hard to enter the kingdom of heaven. The man who knows the art passes through even this life, to use one of the fine phrases of Marcus Aurelius, 'like one who has entrusted to the gods, with his whole soul, all that he has.' Suppose such a rich man to live in our time! 'Assuredly,' said Solon to Croesus, 'he who possesses great stores of richness is no nearer happiness than he who has what suffices for his daily needs,' but surely he has some means of happiness which the other does not possess."

Machinists and Foundries.

PALMER, KNOX & CO., Golden State Iron Works,

of Mr. LOCHHEAD, who has been in the business in San Francisco for the last forty years, and enjoys the reputation of having built ONE HUNDRED AND SEVENTEEN STEAM ENGINES.

Screw Propellers of all kinds, and Steam Boat Machinery generally, made to order, and warranted to give perfect satisfaction in every particular.

25v12-3m

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Bag, Screw and Drop Presses, Colining Machinery, File Drivers, Bark and Malt Mills, and all kinds of Castings.

ENGINES.—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

BOILERS.—Locomotive, Flat, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

PUMPS.—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's Improved Tractory Onrve Pan, Zenas Wheeler's Improved flat bottom pan, Beldin's pan, Veatch's tub, Prater's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

OIL BORING TOOLS AND MACHINERY.—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

(Written for the Mining and Scientific Press.)

The Northern Mines.

EDITORS MINING AND SCIENTIFIC PRESS:—

As various exaggerated and ridiculous reports are being daily circulated in San Francisco and in the Eastern States, about the fabulous richness of our Idaho quartz mines, permit an old quartz miner, through the medium of your columns, to furnish a few facts and statistics which may help to expose these "canards," which have already done considerable injury to a country, portions of which it would be vain to deny possess gold and silver bearing lodes of considerable merit, and which, if properly developed, and the ore reduced by competent men, would in a short time pay fair dividends to the shareholders.

First of all, let us glance at Owyhee, with her numerous mines of gold, silver, and in fact every mineral substance known to the chemist. We hear occasionally of some shipments of bullion from that country. So far, so good. What dividends have ever been declared by any mining or mill company during the last three years? Only one, and that was from 100 tons of ore, taken from an extremely rich pocket in a mine known as the Poorman. The Oro Fino mine, which has furnished 99 per cent. of all the bullion shipped from that country, does not pay expenses. Many thousand tons of ore have been worked from this mine, and the owners are still in debt to the Morning Star Mill Company for its reduction. On the reputation of this mine alone, ten mills have been erected, chiefly by Eastern capitalists, on the representation of unprincipled speculators and agents. Of course, they have all proved failures; but Owyheans are not satisfied with quartz. A few pieces of crystallized quartz are found, and we hear of the "Diamond Mines" of Owyhee, destined to eclipse those of Golconda and Brazil. A piece of bitumen and the "coal mines" of Owyhee, are pronounced to be more extensive than those of Pennsylvania. A seam of "red hematite," and the "Cinnabar" mines of Owyhee are richer than those of Almaden, and so on.

Too much money has already been wasted on the "elephant" in Owyhee.

The Rocky Bar mines are situated about ninety miles in a northeasterly direction from Boise City; they have been worked about two years and a half, many of them having proved extremely rich in gold. A large amount of money was taken out by the pioneers of the camp, in anartras, some of the ore paying \$125 per ton, in gold; but the miners were not satisfied with these results, and they must have mills. Companies were organized in the East, and the mills arrived and were put up. What was the result? From three to ten dollars per ton by mill process!

The fault lies entirely with the superintendents. The machinery was got up in the States by men who had never seen a mine or a mill in their lives, and who were entirely ignorant of the first principles involved in the extraction of gold and silver. A small piece of copper in front of the battery was, by these persons, considered quite sufficient for the reduction of a very rebellious ore. It is needless to say that all these mills are failures, and stand idle. In the meantime, the anartras have fallen to pieces, and there are no means wherewith to build new ones.

About fifteen miles north of Rocky Bar, is the Middle Boise or Yuba district. This is destined to become the richest mining district north of Washoe. The ledges are numerous and well defined, some of them from sixteen feet to twenty feet in width. The natural advantages of the country are very great, the supply of timber being inexhaustible, and the mountains as heavily timbered as any portion of the Sierra Nevada. The water power is sufficient to run any number of stamps. There are already three quartz mills and a saw mill on the road for this district, of which Messrs. Baker and Defrees are the proprietors. These gentlemen, who are thorough metallurgists and millmen, have closely examined the Yuba mines, and express themselves fully convinced of their richness. Several other scientific and practical men from San Francisco, have lately visited these mines. Among others, I may mention Col. O'Neill, Mr. Bryant and Mr. Woods. They all predict a glorious future for the Yuba or middle Boise district. In a future letter, I will describe the other quartz camps of Idaho, all of which I have visited on my northern tour.

WASHOE.

Rocky Bar, Alturas Co., Idaho Terr., July 12, 1866.

THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequalled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call special attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Oreno Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully solicited.

Important to Californians.—Many inventors have

ately had their claims for Patents seriously (and in some

cases fatally) delayed by the unqualification of agents who

have not complied with the Government laws and revenue

laws, as well as other new and imperative regulations.

These discrepancies, although arising from the inexperience

of honest agents, are none the less dangerous to applicants

for patents, whose safest course is to trust their business

with none but active and experienced solicitors. The Mining

and Scientific Press Patent Agency has strictly complied

with the requisitions of the Department, and properly

filed all necessary papers as Claim Agents.

METALLURGICAL WORKS,

—AND—

Practical Mining School,

Bryant Street, Between Third and Fourth,

SAN FRANCISCO.

THE PROPRIETORS are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphurets, pyrites, and the so-called "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

SACRAMENTO, April 16th, 1866.

H. BOWMAN—DEAR SIR: THIS IS THE FIRST WRIT-

ing I have done in two years, and it affords me great

pleasure to be able to use my pen in the service of those who

are suffering, as I have suffered, by stating the following

facts:

I have for two years and upwards been afflicted with

CHRONIC RHEUMATISM, and until a few weeks ago I

have never found anything that afforded me any relief.

For three months of the time I was unable to feed myself,

and for the last five months my arms have been so bent

that I have not been able to dress myself. I was five months

at the Warm Springs, at San Luis Obispo, and three months

at a Hydropathic Institute in Stockton, and I have been

under the care of six different physicians in the vain hope

of relief. About six weeks ago I was cured by a person

who had been cured by it to try a bottle of RICHARD'S

REMEDY FOR RHEUMATISM, and in less than twelve

hours I experienced great relief. In a few days I was

enabled to straighten out my arms, and I have been, eating

better and gaining in strength and flesh ever since. I have

now the complete use of all my limbs, and, for the first

time in two years, I am out of pain. I feel for those

who suffer as I have suffered, and if they will take my

advice, they will lose no time in giving the REMEDY A TRIAL.

Yours truly,

GEORGE TAYLOR.

RICHARD'S REMEDY is for sale by

H. BOWMAN,

Druggist, Sacramento.

Price, \$2.50 per Bottle.

A Rare Chance!

A Splendid Business in Alameda County.

FOR SALE AT A GREAT BARGAIN,

400 ACRES OF LAND,

INCLUDING

Landing, Wharf, Three Capacious

Warehouses,

Capable of holding 12,000 Tons, which amount of grain

was stored and shipped the past year. Connected with

said business there is an extensive Lumber Yard; sales

during last year, two million feet, which sales, and the

entire business, can be largely increased.

The above is a rare opportunity for parties desirous of

engaging in an active business that will pay a large dividend

on the investment. Satisfactory reasons given for

selling, and all information desired can be obtained on ap-

plication by mail, or otherwise, to

G. E. SMITH,

Notary Public and Searcher of Records, Office "Beatty

House," San Leandro.

23v12 m

Capitalists, Attention!

QUARTZ MILL & MINING PROPERTY

FOR SALE

In Nevada County.

A NEW 8-STAMP QUARTZ MILL, 7 LEDGES AND 640

acres heavily-timbered Land, near Eureka, Nevada

County, are now offered for sale. The Mill is run by

steam power, and is in complete order for business. The

ledges, which form the principal vein of this property, are

all large and well-defined, but require a further outlay of

capital, in order to make them remunerative. For the lack

of means to properly develop these claims, the present own-

ers are disposed to sell the same for a reasonable price.

Capitalists wishing to engage in mining will find this a

splendid opportunity to purchase a property that will bear

right scrutiny, and offers superior inducements as an in-

vestment.

For address and further information, Inquire of the Pub-

lishers of the Mining and Scientific Press, 505 Clay

Street, San Francisco.

22v12

The Press is a large, sixteen-page paper, and is truly a

valuable assistant to the mining interests of the Pacific

Coast.—[Nye County News.]

Eyes! Eyes!! Eyes!!!

DR. HENLY, OCULIST AND AURIST, HAS received from Scotland one of the most successful REMEDIES for the benefit of the HUMAN EYE ever before discovered. It is unparalleled in its effects upon the disease incident to this organ. It gives wonderful power to the optic nerve, and all the granulations from the lids, and all mucous film from the sclerotic coat without the use of instruments. In fact, it works like a charm on the Eye, without giving any pain. You feel the effect of the medicine in different parts of the head. It drives the disease back into the system, which is better able to stand it than this tender organ.
Persons who have been blind for ten years have been restored to their sight in a short time by the use of this medicine. I will treat any person's eyes in the State, and if I do not give them relief in a short time, I will not charge them anything. Office, No. 731 CLAY STREET, opposite the Plaza, San Francisco. 22-v12

City College Laboratories,

Southeast Cor. Stockton and Geary sts.

Practical and Analytical Chemistry and Metallurgy.

THOMAS PRICE,

Professor of Chemistry,

(Formerly of the Normal College, Swansea.)

WILL GIVE PRACTICAL INSTRUCTIONS IN QUALITATIVE AND QUANTITATIVE ANALYSIS AND ASSAYING. The course qualifies students for the application of Chemistry to METALLURGY, MANUFACTURING ARTS, and MINING PURPOSES.

PHARMACEUTICAL and TECHNICAL CHEMISTRY, such as is required by Medical and Pharmaceutical Students, will be taught to such students as may require it.

Course of General Chemistry.

Evening Lectures will be delivered every Tuesday, at half-past seven o'clock, P. M., in the Philosophical Hall of the College, without extra charge to the students in the Institution.

On and after the 14th of February, the Laboratories will be open every day, except Sundays, from 8 A. M. to 5 P. M. For further particulars, address

REV. P. V. VEEDER,

Principal of the City College.

Or at 406 California Street.

YOUNG MEN WANTED!

Pacific Business College!

M., at which a full representation of the capital stock is requested. By order of the Board of Trustees.

T. W. COLBURN, Secretary.

Cortez Gold and Silver Mining Company.

Location of Works: Cortez District, Lauder County, State of Nevada.

Notice is hereby given, that the Annual Meeting of the Stockholders of the above-named Company, will be held on FRIDAY, the tenth day of August next, 1886, at 3 o'clock P. M., at the office of the Company, for the election of Trustees to serve the ensuing year, and for the transaction of other business.

R. N. VAN BRUNT, Secretary.
Office, No. 331 Montgomery street, San Francisco, Cal. jyl4

Cordillera Gold and Silver Mining Company, Chihuahua, Morelos Mining District, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighteenth day of July, 1886, an assessment (No. 7) of one dollar per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, No. 321 Washington street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the twenty-fourth day of August, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the thirtieth day of September, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

H. R. REED, Secretary.
Office, 321 Washington street, San Francisco, Cal., near Front.

N. B.—Until further notice, all advertisements of this Company will appear in the Mining and Scientific Press.
San Francisco, Cal., July 19th, 1886. jyl2

Dianna Gold and Silver Mining Company, Lander County, Nevada.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the seventh day of June, 1886, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Allen, H. H.	236	3	\$15 00
Allman, Jno	304	7	35 00
Allmon, Jno	305	6	30 00
Bosteman, J. C.	211	4	20 00
Blideman, F. G.	333	17 1/2	83 75
Cutter, H. F.	14	21	105 00
Cutter, H. F.	20	10	50 00
Cutter, H. F.	218	10	50 00
Camp, Jaa	330	10	50 00

Neyman, H. J.	334	1	5 00
Waterman, E. R.	38	2	10 00
Welch, G. W.	200	10	50 00

And in accordance with law and an order of the Board of Trustees, made on the seventh day of June, 1886, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, by Messrs. Jones & Bendish, on Friday, the tenth day of August, 1886, at the hour of 2 o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

N. C. FASSETT, Secretary.
Office, 402 Front street, San Francisco. Cal. jyl2

Del Norte Comstock Company.—Location: Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twentieth day of July, 1886, an assessment of one dollar and forty-five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 331 Montgomery street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the thirtieth day of August, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-fourth day of September, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

R. N. VAN BRUNT, Secretary.
Office, 331 Montgomery street, San Francisco, Cal. jyl2

Eagle Quartz Mining Company.—Location of Works: Amador County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eleventh (11th) day of July, 1886, an assessment of one (1) dollar per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at the office of the Company, No. 10 Exchange Building (13th Montgomery street), San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the thirtieth (30th) day of August, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the fifth day of September, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN M. BURNETT, Secretary.
Office, No. 10 Exchange Building, San Francisco, California. jyl4

Great Central Mining Company.—Location of Works: Yuma County, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the second (2d) day of July, A. D. 1886, an assessment of one (1) dollar per share was levied upon the capital stock of said Company, payable immediately, in gold coin of the United States of America, to the Secretary, of the office of the Company, No. 302 Montgomery street, between the hours of 5 P. M. and 6 P. M.

Any stock upon which said assessment shall remain unpaid on the third (3d) day of August, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on the twenty-seventh (27th) day of August, A. D. 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

O. D. SQUIRE, Secretary.
Office, No. 302 Montgomery street, San Francisco. jyl7

George Washington Gold and Silver Mining Company, Silver Mountain District, Alpine County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 26th day of June, 1886, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law and an order of the Board of Trustees made on the 26th day of June, 1886, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of Messrs. Olney & Co., at No. 413 Montgomery street, San Francisco, Cal., on the 13th day of August, 1886, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

W. D. ROOT, Secretary.
Office, 338 Montgomery street, San Francisco. jyl2

Lady of the Lake Gold and Silver Mining Company, San Francisco District, Mohave County, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 20th day of July, 1886, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company, payable on the twenty-first day of July, 1886, in United States gold and silver coin, to the Secretary, at his office in San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the 2d day of August, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 10th day of September, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. HOLLIS, Secretary.
Office, No. 302 Montgomery Street, Room No. 2, third floor, San Francisco, Cal.

N. B.—By resolution of the Board of Trustees, it was ordered that a discount of three per cent. be allowed on all payments made prior to August 2d, 1886.

WM. HOLLIS, Secretary.

Leland Gold and Silver Mining Company, San Francisco District, Mohave County, Arizona Territory.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 20th day of July, 1886, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company, payable on the 21st day of July, 1886, in United States gold and silver coin, to the Secretary, at his office in San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the 22d day of August, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 19th day of September, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. HOLLIS, Secretary.
Office, No. 302 Montgomery street, Room No. 2, third floor, San Francisco, Cal.

N. B.—By resolution of the Board of Trustees, it was ordered that a discount of three per cent. be allowed on all payments made prior to August 2d, 1886.

WM. HOLLIS, Secretary.

Lady Bryn Gold and Silver Mining Company.—Location of Works: Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twentieth day of July, 1886, an assessment of one (1) dollar per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at the office of the Company, 323 Montgomery street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-fifth day of August, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on the eleventh day of September, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

H. O. HOWARD, Secretary.
Office, 323 Montgomery street, San Francisco. jyl2

Nuestra Señora de Guadalupe Silver Mining Company, Taylito District, Durango, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 25th day of June, 1886, an assessment, No. 24, of one dollar (\$1) per share was levied upon the assessable capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, E. J. PEIFFER, at the office, No. 210 Post street, or to the Treasurer, A. HUMPHREY, at his office, No. 637 Washington street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the 31st day of July, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the 18th day of August, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

K. J. PEIFFER, Secretary.
Office, 210 Post street, San Francisco, Cal. jyl3

POSTPONEMENT.—The day for deeming stock delinquent on the above assessment is hereby postponed until Monday, the 27th day of August, 1886, and the sale thereof until Monday, the 17th day of September, 1886. By order of the Board of Trustees.

E. J. PEIFFER, Secretary.

Sweet Vengeance Gold and Silver Mining Company, Brown's Valley, Yuba County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the twenty-first day of June, 1886, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law, and an order of the Board of Trustees, made on the twenty-first day of June, 1886, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Olney & Co., at No. 413 Montgomery street, San Francisco, on the fifteenth day of August, 1886, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

F. S. SPRING, Secretary.
Office, No. 705 Sansome street, San Francisco. jyl2

Our Circulation.—THE MINING AND SCIENTIFIC PRESS has a large and permanent subscription list, and enjoys a more universal circulation among stockholders and persons directly interested in mining than any other paper on this coast.

Scott Mining and Exploring Company.—Location of Mines, etc., in Humboldt County, State of Nevada.

Notice is hereby given, that at

THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Miller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; a, Dies; c, Shoes, and O, Openings.

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan when properly constructed, are respectively 177, 118 and 132.

That is, the respective millers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan one hundred and eighteen tons, and the Conical Pan one hundred and thirty-two tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the miller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes direct from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been furnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,
WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the
PACIFIC FOUNDRY,
171 San Francisco.

IRON!

Glasgow Iron and Metal

IMPORTING COMPANY,
Nos. 25 and 27 Fremont street, San Francisco,
Keep constantly on hand a large assortment of

LEFFEL'S

American Double Turbine

THIS WHEEL, WHICH HAS HAD THE most unprecedented sale of any water-wheel ever made, and which has given unusual satisfaction whenever used, is now for sale by KNAPP & GRANT, 310 Washington street, San Francisco, where persons desiring to use water-power can be supplied. These Wheels are adapted to use from 10 to 5,000 feet of water, and from 4 feet to 500 feet fall. Let us know how much water you have either in rivers, creeks or cisterns, what fall you have, and what power you require. Write or send for circular to
KNAPP & GRANT,
—ALSO—
San Francisco.

Leffel's Lever Jacks,

For railroads, cars, or wagons; Railroad Jacks for engines and cars; Track Jacks for leveling, with which three men, with a pair of these Jacks, can level more track in a day than twelve men working in the ordinary manner; also, Track Jacks, for relieving the axle of pressure to replace the brass. These Jacks are now in general use in the Eastern States, and give entire satisfaction. Also, Wagon and Track Jacks of the most superior make and kind. For sale by
KNAPP & GRANT,
San Francisco.

BAUX & GUIOD'S Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine Superior Knowledge with Practical Experience, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators in addition to the ordinary Amalgamators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jeffersonian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crall's Gravel Cement Works, Nevada county; Waltham's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works and San Francisco Foundry, San Francisco, and at Hough & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address
J. B. BAUX,
Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8-6d1

To Ditchmen, Millmen and Others Requiring IRON PIPE.

M. R. ROSE, CORNER OF 9TH AND K STREETS, Sacramento City, has facilities unsurpassed on this coast for the manufacture of IRON PIPE of every description. He also has on hand a deep well FORCE PUMP, of his own invention and manufacture, well adapted for oil wells. His tools being portable, pipe can be manufactured on the ground. 19v12

EXCELSIOR PUMP!

THIS DOUBLE-ACTING SUCTION AND FORCE PUMP CHALLENGES COMPETITION for simplicity, durability and power, and will work at any depth. The pistons for Mining Pumps are packed with hemp. The valves are reached by simply removing the "bonnets" thereby avoiding the trouble of raising a long column of pipe. They will raise as much water as TWICE their size of single-acting Mining Pumps, and are sold at half the price. We have never heard of the valves in this Pump being out of order. For their many superior points they are fast replacing all other Force Pumps. References can be given where this Pump is working with eighteen others of different patterns, and is pronounced THE BEST; also, from some of the best miners in the State who have them in use. For manufacturers, farms or domestic use, we warrant them the best and cheapest. All sizes adapted to any power or any purpose. For sale by agents throughout the State.

June 23, 1865.

Union Amalgamator.

This Valuable Invention

IS FAST FINDING ITS WAY INTO GENERAL USE, NOT by means of combination of capital and influence, but on the strength of its own merits, and upon the principle that what is known to be good will be appreciated. Practical men acknowledge the UNION PAN to be scientific, the best, the cheapest, and most profitable. It now stands first on the list of all pans in use for the purpose of

Working Gold and Silver Ores.

It has been found that a low class of ores, also tailings from Mills, Sulphurets, etc., that will not pay to work with the common pans, may be worked with this and obtain large profits. The UNION PAN is manufactured in two sizes, and capable of operating upon large quantities of ore in the most efficient manner. Parties interested in Quartz Mining, Mills, etc., will find it to their advantage to call and examine for themselves, and see its operation. Gold and silver ores tested by regular mill process, at moderate cost, by

STRONG & CO.,

San Francisco, Foundry, corner Mission and Fremont streets, where orders will receive prompt attention. 15v12-3m

BRUCKNER'S Mechanical Roasting Furnace

AWARDED A

PREMIUM SILVER MEDAL

—BY THE—

The Mechanics' Institute.

THESE FURNACES ARE NOW MANUFACTURED AFTER an improved mode of construction, which

GREATLY SIMPLIFIES THEIR OPERATION,

and afford a much larger oxidizing surface to the action of heat and atmosphere.

The weight of a Furnace nine feet long by four feet in diameter does not exceed one ton.

THE IMPROVED FURNACE

May be seen in operation, for desulphurizing or roasting and chloridizing, at Central Mill, Virginia City, Nevada.

Parties wishing to erect such Furnaces, are requested to leave their orders with

T. KALLENBERG,

19v12 416 Market street, San Francisco.

FLORENCE SEWING MACHINES!

COPY OF THE REPORT OF THE COMMITTEE OF AWARDS AT THE FAIR OF THE

AMERICAN INSTITUTE,

New York, 1865,

—TO THE—

Florence Sewing Machine Company,

FOR THE BEST FAMILY SEWING MACHINE.

HIGHEST PREMIUM—GOLD MEDAL!

REASONS:

- 1st.—Its simplicity and great range of work.
- 2d.—The Reversible Feed Motion.
- 3d.—The perfect finish and substantial manner in which the machine is made.
- 4th.—The rapidity of its working and the quality of the work done.
- 5th.—The Self-adjusting Tension.

The "FLORENCE" was awarded the First and Highest Premium at the State Fair of California, the only Fair on the Pacific Coast at which any two double-thread Sewing Machines were exhibited in competition in 1865.

The "FLORENCE" received the only premium awarded by the Mechanics' Institute of San Francisco, in 1864 and 1865, for any Sewing Machine. Sewing Machine Company, or Agent. The claim of a competitor to a medal is without any foundation whatever.

Wherever the "FLORENCE" has been brought in competition with other Sewing Machines, it has always been declared the best. It is the most simple, the most substantial, the most efficient, and its use is easily learned. Every Machine sold is guaranteed in the full sense of the word.

Send for Circulars and Samples of Work.

Nos. 116 and 118 California street 2v12 3m

Pacific Forge Company.

FORGING AND IRON WORK.

THE PACIFIC FORGE COMPANY HAVE JUST ERECTED, in this city, on Fourteenth street, near the machine shop of the San Jose Railroad, a large establishment for the purpose of forging and working in wrought iron. Our hammer is the largest upon this coast, and we are prepared to manufacture, at short notice, all kinds of heavy forgings, car axles, shafts, steamboat cranks, piston-rods, wagon axles, and other similar work. This is the first general shop of the kind erected in this State, and we solicit the patronage of the public. All orders executed at reasonable rates, and with promptness and satisfaction. 19v12-3m

Mining near Boise City, Idaho Territory.

A correspondent writes from Boise City, Idaho Territory, as follows:

It appears to me that a more extended circulation of the MINING AND SCIENTIFIC PRESS among the hundreds interested in quartz operations in this Territory, would save many from the failures which they are now making, wholly in consequence of their want of a proper knowledge of the work in which they are engaged. Of Owyhee, all that now can be said is that every one that could go, is off hunting the Indians. It would take a constant force, for two or three years, of 1,500 mounted men, to thrash these pests of this country.

Mons. De la Baume has been further experimenting on his process. It consists in roasting the ore, and then plunging it, whilst hot, into a chemical bath; but I have the idea that his chemicals are sal-soda and strong lye, but do not know for certain. He succeeds, however, in saving a large proportion of silver, which has hitherto been lost, and claims to be able to work about three times as much rock as by the usual process, without wasting. The experiments he has made have shown that the South Boise rock is not only productive of gold, but is rich in silver.

The reputation of South Boise has become bad through bad management, and, if charges be true, of no small amount of rascality on the part of overseers of works. In all lodes that have been sunk upon, the sulphides are fast increasing, whilst the free gold decreases. The true process for that country, however, is the Swansea process by smelting, and both at South Boise and Yuba, the facilities in the way of wood, grass and water for that system are most excellent. In fact, it would be cheaper to put up furnaces, and furnish wood, etc., than to transport the cumbersome machinery for the present stamp mills and pans through the mountains. There is a considerable quantity of iron, sulphur and antimony in all the South Boise rock.

Yuba is twenty miles east, or little north, of Rocky Bar, but there is not yet any wagon road to that place.

The Leonora lode, at Yuba, is the richest (apparently) ever found. It contains a streak, along the lode, varying from one to fourteen inches thick, in which the gold is in layers about as thick as thin sheets of paper, and between each layer of gold is about half an inch of decomposed, clayey quartz, full of fine gold. This streak has been suuk on for over thirty feet, and Mr. Cavallin, assayer at Rocky Bar, pronounces it worth over \$200,000 to the ton, which is cut out with cold chisels. Outside of this rich streak is a good lode four or five feet wide, in which is plenty of rock that will pay an ounce of gold to a pound of rock. The Atlanta has the appearance of being as good and lasting a lode as any in Yuba. I am of opinion that the developments made in Yuba will show that to be the richest quartz country ever yet found; the ledges are large, well defined and run down nearly straight, the dip rarely exceeding twenty degrees.

The difficulty is high wages. Men ask \$6 to \$8 a day. When men will be satisfied to take \$75 a month in gold and board, these mines will be worked to full advantage; but to employ thirty men at a cost of nearly \$5,500 a month, takes off the profits very fast.

Men, during the past winter at Yuba, by hoisting rock and taking it to their cabins, made wages pounding it in hand mortars.

J. B. CONE, BUSINESS AGENCY.—Makes private sales of Property and Business Places of every description, in the city and throughout the State; procures partners with large and small amounts of money; negotiates sales of mining property, and does a General Agency Business. Patronage solicited by mail, express, or by personal application at the office, 402 Montgomery Street, San Francisco, California. 23v111r

COPPERAS! COPPERAS!

200 BARRELS COPPERAS—SULPHATE OF IRON. For sale, in lots to suit, by BENJAMIN BRADY, 103 California street, Southwest corner of Davis, up-stairs. 24v12

THE MINING PRESS has entered upon its thirteenth volume. It is a valuable publication in its sphere, and its sphere is a large and important one.—(Marysville Appeal.

Knox's Improved Patent Amalgamator and Separator,
With Palmer's Patent Steam Chamber or Die.

For further particulars, inquire of

ISRAEL W. KNOX, or
W. A. PALMER, inventors,

At the Golden State Iron Works, No. 10 First street, San Francisco.

THIS CUT REPRESENTS AN AMALGAMATOR and Separator that has stood the test of many years' practical working in the gold mines of California, and for nearly the same time in the silver mines of Nevada, having been introduced into the first steam mills built in the latter Territory, since which time they have been successfully working against all competition.

The great advantages these Amalgamators have over any others, are—

1st. Much less Cost.

2d. They do not "flour" the mercury, and collect any that may have been "sickened" in the battery or grinders.

3d. The "sloshing" motion given to the pulp (by the revolution of the muller under the stationary frame) against the amalgamated copper plates that are fastened to the frame, and by this means catching the fine gold and mercury that will not settle.

4th. The gate in the cone, through which the pulp is discharged, from the top, and where there is the least motion, almost precluding the possibility of any granulated mercury or fine gold escaping.

There are over 500 of them in use in California and Nevada, where those interested can see their practical workings.

HUNGERFORD'S IMPROVED CONCENTRATOR,

FIG. 1.

For Saving Gold, Sulphurets, Quicksilver, Etc.

FIG. 2.

There is no description of machinery of so much importance to the mining interests of California, at the present time, as that for the separation of sulphurets. Mines are now abandoned, or, what is worse, paying assessments which, if the sulphurets were saved, would yield handsome dividends. Great difficulty, owing to the varied form and character of the sulphurets, has been experienced in devising a machine to separate them, and it is only by close and patient observation, persevering study and careful experiment, that any machine can be made or matured so as to save a high per centage of the sulphurets which are in the ore. No machine is so perfect as to save all; and the best is that which will save most with the least expenditure of time, money, and power. Many machines have been tried, and many abandoned; all of which have been tried, and many abandoned; all of which have been tried, and many abandoned.

The separating or concentrating action is obtained by centrifugal force and gravitation; the pulp being preserved by water in the proper condition for the operation, and the pan so constructed, mechanically, as to allow the centrifugal force and gravity to expend themselves to the best advantage in producing the separation, as well as to make the machine simple, compact, and easily kept in order.

Fig. No. 1 is a perspective view of the Concentrator while in operation, showing the general arrangement. Fig. No. 2 is a section through the centre of the pan, showing how it operates in separating the sulphurets, as well as the great improvement to the pan, which consists of the addition of a circular trough outside the periphery.

Its operation is as follows: The pulp flows from the spout through the filler into the bowl at the top, from which it is distributed equally over the convex cover into the pan near its outer edge. The lightest sand is at once carried off with the overflowing water through the centre opening, and the sulphurets are allowed, from the motion given to the machine, to gravitate to the bottom toward the outer edge, forming an embankment all around the pan, as represented at 1, 1, Fig. 2. The lighter particles of the sand arrange themselves on the top at 2, 2, Fig. 2, from which they are being constantly washed away with the water flowing through the central opening. The sulphurets are, by the centrifugal motion of the machine, made to pass through small openings at the bottom, at intervals of a few inches around the circumference, through the inner wall of the pan to the circular trough, 3, 3, Fig. 2, where they come in contact with the mercury at the bottom, depositing the free metal, from which it is drawn at pleasure by an opening in the bottom, and the sulphurets, in the order of their density, by openings in the sides.

It will be observed that the sulphurets in the trough, 3, 3, are maintained at the same elevation as the sulphurets and overlying sand in the body of the pan. It will be further observed, that by no possible means can the sand in the latter pass (as the former in such quantities as to form any considerable percentage of the amount saved. The advantages of this improved pan are continuous action, requiring no attention except to remove the receiving vessels as fast as they are filled from the openings shown on the right of Fig. 2, simplicity in construction, and durability and cheapness of cost.

The pan derives its motion from two eccentrics secured on a horizontal shaft passing across and below the centre of the pan and working between two pairs of adjustable wooden guide blocks or bearings. The eccentrics are so made as to bear equally on the wooden guide blocks in all positions while in motion, giving to the pan the most desirable motion for its purpose, and doing away with all complexity of rods, cranks, wooden frame, etc.

These pans are now being introduced into the best mills in the country. Reference to parties who have tested them can be had by applying to the manufacturers.

Those interested in mining, and who call at the Miners' Foundry to see the one which is there in operation, will have no reason to regret their visit.

San Francisco, June, 1866.

HOADLEY'S.

FOUR SIZES,

8, 10, 12, and 15-Horse Power,

HOADLEY'S.

3 to 40-Horse Power.

HITTINGER'S.

THREE SIZES,

5, 7, and 10-Horse Power

HITTINGER'S.

TWO SIZES,

5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, and Economy, with the Minimum of weight and price. These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, thrashing, milling and mining purposes. Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises), in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with and without carriages.

Also, Portable Saw and Grist Mills.
For sale by TREADWELL & CO.,
18v12 Corner of Front and Market streets.

NATIONAL MINING LAW.

The following is the new Mining Bill to legalize the occupation of mineral lands, and to extend the right of pre-emption thereto, which has passed both branches of Congress, received the signature of the President, and is now a law:

Be it enacted by the Senate and House of Representatives of the United States of America, in Congress assembled:

That the mineral lands of the public domain, both surveyed and unsurveyed, are hereby declared to be free and open to exploration and occupation by all citizens of the United States, and those who have declared their intention to become citizens, subject to such regulations as may be prescribed by law, and subject also to the local customs or rules of miners in the several mining districts, so far as the same may not be in conflict with the laws of the United States.

Sec. 2. And he it further enacted, That whenever any person or association of persons claim a vein or lode of quartz or other rock in place, bearing gold, silver, cinnabar or copper, having previously occupied and improved the same according to the local custom or rules of miners in the district where the same is situated, and having expended in actual labor and improvements thereon an amount of not less than \$1,000, and in regard to whose possession there is no controversy or opposing claim, it shall and may be lawful for said claimant or association of claimants to file in the local land office a diagram of the same, so extended laterally or otherwise as to conform to the local laws, customs and rules of miners, and to enter such tract and receive a patent therefor, granting such mine, together with the right to follow said vein or lode, with its dips, angles and variations, to any depth, although it may enter the land adjoining which land adjoining shall be sold subject to this condition.

Sec. 3. And be it further enacted, That upon the filing of the diagram as provided in the second section of this act, and posting the same in a conspicuous place on the claim, together with a notice of intention to apply for a patent, the Register of the Land Office shall publish a notice of the same in a newspaper published nearest to the location of said claim, and shall also post such notice in his office for the period of ninety days; and after the expiration of said period, if no adverse claim shall have been filed, it shall be the duty of the Surveyor General, upon application of the party, to survey the premises and make a plat thereof, endorsed with his approval, designating the number and description of the location, the value of the labor and improvements, and the character of the vein exposed; and upon the payment to the proper officer of five dollars per acre, together with the cost of such survey, plat and notice, and giving satisfactory evidence that said diagram and notice have been posted on the claim during said period of ninety days, the Register of the Land Office shall transmit to the General Land Office said plat, survey and description, and a patent shall issue for the same thereupon; but said plat, survey or description shall in no case cover more than one vein or lode, and no patent shall issue for more than one vein or lode, which shall be expressed in the patent issued.

Sec. 4. And be it further enacted, That when such location and entry of a mine shall be upon unsurveyed lands, it shall and may be lawful, after the extension thereof of the public surveys, to adjust the surveys to the limits of the premises according to the location and possession and plat aforesaid, and the Surveyor General may, in extending the surveys vary the same from a rectangular form to suit the circumstances of the country and the local rules, laws and customs of miners: Provided, That no location hereafter made shall exceed two hundred feet in length along the vein for each locator, with an additional claim for discovery to the discovery of the lode, with a right to follow such vein to any depth, with all its dips, variations and angles, together with a reasonable quantity of surface for the convenient working of the same as fixed by local rules: And provided further, That no person may make more than one location on the same lode, and not more than three thousand feet shall be taken in any one claim by any association of persons.

Sec. 5. And be it further enacted, That the President of the United States be, and is hereby authorized to establish additional land districts, and to appoint the necessary officers under existing laws, wherever he may deem the same necessary for the public convenience, in executing the provisions of this act.

Sec. 6. And be it further enacted, That whenever adverse claimants to any mine located and claimed as aforesaid, shall appear before the approval of the survey, as provided in the third section of this act, all proceedings shall be stayed until a final settlement and adjudication, in the Courts of competent jurisdiction, of the right of possession to such claim, when a patent may issue, as in other cases.

Sec. 7. And be it further enacted, That wherever prior to the passage of this act, upon the lands heretofore designated as mineral lands which have been excluded from survey and sale, there have been homesteads made by citizens of the United States, or persons who have declared their intention to become citizens, which homesteads have been made, improved and used for agricultural purposes, and upon which there have been valuable mines of gold, silver, cinnabar or copper discovered, and which are properly agricultural lands, the said settlers or owners of such homesteads shall have a right of pre-emption thereto, and shall be entitled to purchase the same at the price of \$1.25 per acre, and in quantity not to exceed one hundred and sixty acres, or said parties may avail themselves of the provisions of the act of Congress, approved May 20, 1862, entitled "An Act to secure homesteads to actual settlers on the public domain," and act amendatory thereof.

Sec. 8. And be it further enacted, That upon the survey of lands aforesaid, the Secretary of the Interior may designate and set apart such portions of the said lands as are clearly agricultural lands, which lands shall thereafter be subject to pre-emption and sale as other public lands of the United States, and subject to all the laws and regulations applicable to the same.

Sec. 9. And be it further enacted, That whenever, by priority of possession, rights to the use of water for mining, agricultural, manufacturing or other purposes, have vested and accrued, and the same are recognized and acknowledged by the local customs, laws, and the decisions of Courts, the possessors and owners of such vested rights shall be maintained and protected in the same; and the right of way for the construction of ditches and canals for the purposes aforesaid is hereby acknowledged and confirmed: Provided, however, That whenever, after the passage of this act, any person or persons shall, in the construction of any ditch or canal, injure or damage the possession of any settler on the public domain, the party committing such injury or damage shall be liable to the party injured for such injury or damage.

Sec. 10. And be it further enacted, That the right of way for the construction of highways over public lands, not reserved for public uses, is hereby granted.

Sec. 11. And be it further enacted, That as a further condition of sale in the absence of necessary legislation by Congress, the local Legislature of any State or Territory may provide rules for working mines, involving easements, drainage and other necessary means to their complete development; and those conditions shall be fully expressed in the patent.

Passed July, 1866.

The above act is copied from the daily reports and may not prove to be verbatim.

Book Printing should be considered and treated as one of the higher branches of the "Art of Arts," and its execution entrusted only to experienced and intelligent workmen. Strict attention will be given to all orders for Book and Pamphlet Printing entrusted to the Mining and Scientific Press Job Office.

ONE HUNDRED DOLLARS REWARD!!!

The above Reward will be paid to any one who will produce evidence of a failure of any of HENDY'S IMPROVED SELF-DISCHARGING CONCENTRATORS, Patented February 27th, and April 17th, 1866—which said amount is deposited for 60 days with Palmer, Knox & Co., No. 19 First Street, San Francisco.

June 23d, 1866.

J. HENDY, Patentee.

Figure 1.

Figure 2.

Hendy's Improved Patent Self-Discharging Sulphurets

PRATER CONCENTRATOR

Is Receiving Universal Favor.

Reference is made to the following Mills which have them now in use:

BENTON MILL, Bear Valley, Mariposa County.
LOUISIANA MILL, near Conterville, Mariposa County.
OPHIE MILL, near Newcastle, Placer County.
C. H. SCHNABLE'S MILL, Doty Flat, Placer County.
CONY MILL, Jackson, Amador County.
SPRING HILL MILL, Amador, Amador County.
GOLDEN GATE MILL, Volcano, Amador County.
RAWHIDE MILL, Jamestown, Tuolumne County.
TRIUNFO G. & S. M. CO., Lower California, Mexico.

And in use in many other parts of this State; also in Idaho, Arizona, Colorado and Mexico. As a further evidence of its worth, orders have been received recently from the proprietors of the following mills, all of whom are using these Concentrators, or have works in the immediate neighborhood of mills using them, viz.:

One Concentrator for the Ophir G. & S. M. Co., near Newcastle, Placer County, ordered by Welly & Foster, who are using two Concentrators; one Concentrator for the Benton Mill, Mariposa County, ordered by Messrs. Dodge & Bro., of this city, who are using seven of them in the same mill; one Concentrator, ordered by Messrs. Bigelow & Bro., of this city, for the Cony Mill, Jackson, Amador County, where they have already three of them in operation.

They may be seen in operation at the GOLDEN STATE FOUNDRY, No. 19 First Street, San Francisco.

DESCRIPTION:

FIGURE 2 is a sectional view. C, is the Hopper in which the tailings are thrown. The tailings then distribute on the Distributor, B. The tailings enter the pan, A, at its periphery, and the debris discharges near its center, and passes off in the spout, F. The sulphurets discharge at gate, E, amalgam and quicksilver at plug, I. J, is a horn-shaped cavity for collecting quicksilver and amalgam. S, is the sulphurets. M, M, the agitating bars, with copper plate, coated with mercury.

The agitating bars operate on top of the pulp. They are acknowledged to be, by those using them, a valuable improvement. [An extra charge of \$15 is made when these bars are furnished.] The pan, A, shows a curve-linear bottom, which gives a more precipitous descent near its center, for the purpose of forcing the sulphurets towards the periphery. It will be noticed that the centrifugal force diminishes towards the center of the pan, for which reason the inclination is increased for the purpose above mentioned.

The pan, A, has an inclination at its periphery, towards the gate, E, for the purpose of forcing the sulphurets to the discharge gate. At the same time the center rim is level; the sulphurets, S, being forced by the oscillating motion of the machine, and are discharged through a small opening in the pan at gate, E.

JOSHUA HENDY, Esq., San Francisco:—MY DEAR SIR: It gives me pleasure to inform you that the four "Improved Self-Discharging Prater Concentrators," which I purchased from you, have now been in operation in the Rawhide Mining Company's Mill for more than two months, and have more than realized my expectations.

I am free to say it is the best Machine for saving Quicksilver, Amalgam, and Sulphurets that I have ever used or seen used for that purpose. I shall take pleasure in showing any one interested the Machine in operation, who will call at the mill. I shall need four more as soon as the balance of our mill is completed. Yours truly,

R. P. JOHNSON, Superintendent Rawhide Mill Company.

A Circular giving further particulars will be mailed to any part of the United States free of expense. Address,

JOSHUA HENDY,

402 Montgomery street, San Francisco, Room 3, Fourth Floor.

[Reported for the Mining and Scientific Press.]

California Academy of Natural Sciences.

REGULAR MEETING, August 6, 1866.

President Ransom in the Chair.

Twenty-two members present.

Minutes of previous meeting read and approved.

Dr. D. J. Macgowan, of Chico, was elected a corresponding member.

Messrs. A. Godeffroy and W. H. Knight were proposed for resident members.

The following papers were presented: By Dr. Behr, on the California species of *Lycena*; by Mr. Stearns, "A List of Shells collected at Santa Barbara and San Diego, by J. Hepburn, with remarks upon some of the species;" by Professor Whitney, "Upon the occurrence of Tungstate of Copper and Silver in Combination in California."

Dr. Ayres laid upon the table several pamphlets, principally proceedings of various scientific societies.

Dr. Ayres called the attention of the Academy to a specimen of a species of black-fish, caught near the Potrero, and now on exhibition near the long bridge.

Professor Whitney presented a singular albino specimen of *sequoia sempervirens*.

Mr. Stearns remarked that Dr. Cooper had obtained additional specimens of the new helix described in the last sheet of the Academy's proceedings—*helix sequoicola*.

Sundry bills were audited and ordered paid. Adjourned. T. H. BLOOMER, Secretary.

HARD TO PLEASE.—We clip the following from the *Denver News* of July 25th:

The MINING AND SCIENTIFIC PRESS of San Francisco has at last discovered that there is a country called Colorado, and that it is a mining region. In its last issue, like the other mining papers of the United States, our Territory is given a place in its "mining summary."

We would simply remark that we have taken the trouble to look over our file from April 28th to the present date. In sight of the fifteen numbers issued within that time, an average of more than half a column in our summary has been devoted to Colorado mines; while in the remaining seven numbers, the space allowed has averaged one fourth of a column. Almost every week, too, this jolly growler is credited with something or other. Pity he don't read the papers! He don't know what he has lost in the last three months!

PASSENGER TRAFFIC.—The number of passengers arriving and departing by sea during the month of July were as follows: Arrived, 2,255; departed, 1,534; Excess of arrivals for the month, 721.

LANDRY'S PATENT COIN ALBUM.

The word "album" is of Latin origin, and was used by the Romans to designate the white table or tablet of porcelain or other material, upon which the names of public officers, and public transactions, edicts, etc., were entered. In modern times the album has taken the form of a bound book, with black leaves, on which friends and distinguished strangers might leave their autographs or write some token of regard or words of advice

of a semi-circular box or holder, A, with cover, C, mounted upon standards, B, B; c, represents the axle passing through the sides of the box, and to which the leaves or tablets, F, are attached by the arms b, b. E, E, are the side rails, which, when closed together, form a segment of a circle. D, D, are the top and bottom rails of the leaves, between which is inserted two sheets of glass. For confining the coins a piece of pasteboard is employed, with holes cut in it of the desired size to receive the individual coins; this perforated pasteboard contains

LANDRY'S PATENT COIN ALBUM.

as a memento. Albums are also used as a receptacle of photographs, forming a ready and safe book wherein to keep the portraits of our relatives and friends.

But Mr. Norbert Landry, of this city, has conceived the happy idea that an album might be invented to provide a safe repository for coins, that would give at once a view of both sides, without soiling or presenting opportunities for the money to be stolen while being exhibited.

We give annexed an illustration of this invention, which we would prefer to call a coin cabinet, rather than an album, which consists

ing the coins, is placed between the two glass plates, and inserted in the frame, D, at the top, and pressed down to the lower portion of the same, where it is kept in position by stops and screws.

By this arrangement, both surfaces of the coin can be seen without handling, and the leaves can be turned on their axis, one after the other; and after inspection is ended, the box can be closed and locked.

To numismatologists, and all who are curious in saving coins, we would recommend this album, which has been patented through the MINING AND SCIENTIFIC PRESS PATENT AGENCY.

The inventor has presented one of these albums to the Numismatic Society of Boston, from which he has received a flattering compliment, as a testimonial of their appreciation of his invention.

NEW CEMENT CLAIMS.

We are informed that locations have recently been made by Theodore G. Kearsing, on Table Hill, on the South Fork of the Stanislaus River, Tuolumne county, distant westwardly from Northrop's Hotel about two miles. Our informant states that a small quantity of the material was worked in the Union pan, and yielded \$135.14 gold to the ton of 2,000 pounds. There were fifteen owners originally, now reduced to but few, and all of them good practical men, who know how to appreciate a good claim. They intend to work it vigorously. Several hundred pounds (as good as tons) were subsequently tested in the same pan, giving \$210 per ton. If gravel of the character worked in these trials can be obtained in any considerable quantity, the claims must be very valuable.

The claim is known as the "Wilson Gold and Cement Company." Charles Wilson is the principal owner, and on the strength of this last test, we understand that he has been offered a handsome sum for one-fifteenth, but declined a sale.

The extension claim, entitled the "Bonker Hill Gold Cement Company," is owned wholly by a prominent gentleman of this city, who was exceedingly fortunate to obtain it at a nominal price before its value was fully understood. It gives promise of being equally as good as the Wilson claim, and in the hands of the party will be made to add greatly to the already well merited and established character of the mines in Tuolumne county.

It is believed by those competent of judging by a long residence in that county, that the placer mines there have yielded but a moiety of gold in comparison to what the quartz ledges and cement and gravel claims will yield in the next decade. Evidence is daily accumulating from different parts of the State, even where placer mines have been good, giving indisputable proof that the greatest amount of gold lies in the quartz ledges and the immense deposit of cement and gravel found in old river beds.

In view of the placer mines proper, becoming, as a general thing, unprofitable to white labor, a more permanent character of mines is awaiting the coming of the patient and toiling miner, giving him promise of reward for his hard toil. The mines of this State most, for centuries, be its principal source of wealth.

MINING REPORTS.—We have received the "Annual Report" of the Savage Mining Company, for the fiscal year ending July 10th, 1866, but too late for any further reference this week.

We have also received the Prospectors' and Managing Directors' Report of the Hamilton G. & S. M. Co., of Nye county, Nevada, to which we shall refer more fully next week.

A FAST BOAT.—Daniel Drew, a Hodson river boat, recently ran sixteen miles in thirty-five minutes.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

(Written for the Mining and Scientific Press.)

Markleville Correspondence.

EDITORS PRESS:—While the Old Word is speaking to the New, and, receiving answers with the speed of the lightning's flash, it is but right that the mountains should speak to the seas; and although these mountains broke "everlasting silence" more than three years ago, and the hum of industry has ever since been heard on every hand, and the wild savage has been startled in his forest home by the swift approach of the industrious white upon his wild hunting grounds; still it seems that we scarcely have a name a hundred miles away. True, we have not made great shipments of silver bullion, nor have we been able to say that we have ever had any mines sufficiently developed to keep any one mill running any great length of time, but we have worried through the darkest hour of our "Pilgrim night," and now the morning of a glorious day is dawning upon us, and may the glorious sun of that day never go down!

Our mines are slowly but surely being developed, and before another twelve months shall have passed away, we shall be courted by the great and small—the man of means and him that hath none. Many of our most important mining companies are driving ahead with that faith that will remove mountains.

THE GREAT EASTERN COMPANY,
Which, by the way, is but a few miles from this place, have been, and still are, driving their works in the Raymond district, and will soon cut their ledge at a great depth. This is an Eastern company, having a large capital, who are not afraid to use it in mining operations as some are. Their claim is looked upon as being a number one claim, and their superintendent, Mr. Pilkington, is the man who knows how to manage the affairs of a great company—the right man in the right place.

THE ST. HELENA COMPANY
Are also driving their works in Alpine district, and very near this place. This company is constantly drawing money from the East, and have a fine prospect ahead. They have abandoned their shaft for the present, and are running a tunnel so as to cut their ledge at a depth of some three hundred feet. They already have pay ore in their shaft, but being troubled with water, have concluded to run a tunnel before sinking it deeper.

THE GEORGE LAW COMPANY
Have been driving their works during the entire spring and summer, and now have a fine tunnel of four hundred feet into the mountain. This company is incorporated in Virginia City, and is composed of capitalists who are not afraid to expend fifty or a hundred thousand dollars in prospecting. Their works are in sight of this place, and their superintendent, Mr. Wells, lives in our town, and knows how to keep the works going ahead. The general impression is that their ledge dips from them, and, consequently, it will take the longer to reach it, but at a greater depth, and should they find only a flattering prospect, it will be sufficient inducement for them to put up extensive works, and sink to a great depth.

THE GOOD HOPE COMPANY
Are, unfortunately, lying still this summer. This claim is looked upon as being the best claim in the county for the amount of work expended upon it. The ledge is well defined, having fine walls and good casings, while the rock is of a blue cast, and prospects well.

THE MORNING STAR COMPANY
Continues to persevere, and the day is not far distant when they will be handsomely rewarded for their labor and perseverance. They have recently contracted with a San Francisco company, and sold them ten thousand tons of ore at \$17.50 per ton; the contracting party to be at all the expense of taking out and working the ore. I have understood they contemplate working it by the smelting process.

P. S.—Some of our old pioneer friends who went to the East and elsewhere, have recently returned, and think more of Alpine county than all the world beside. This speaks well for our Alpine rights; and while other mining localities are having a general stampede from them, Alpine county has none of this, but holds her own; and the few who have gone away contemplate returning in a few months, and in the mean time their places are being filled up by new comers.

SIXKON.

Markleville, August, 3 1866.

Shasta County Quartz Mines.

[Extracts from a private letter.]

Parties here from Summit City pronounce this the richest district they have ever seen, and express great astonishment that we appear so apathetic; but they are soon convinced that we have great confidence in our mines, but have no money to proceed. Parties from San Francisco are expected here daily, and I have no doubt this visit will be productive of great good to the district. The Chicago company have exposed some of the richest ores ever found in quantities in the country. It is safe to say the ore is over half mineral, containing in the neighborhood of \$1,000 per ton silver, and that too, only nine or ten feet from the surface. There is a vein about fifteen inches wide of that character, and the balance of the ledge has mineral enough in it to pay well for working. The ledge is about three feet wide between "flukins." I have not been able to do much on my claims; but they look finely, and rank next to the Chicago. Will commence work on the Eclectic extension, as soon as miners can be had. Have found fine ores on the Eclectic since my last. This series of ledges appears to be the strongest in the district, and will assuredly speak for themselves when opened. If this district does not degenerate very rapidly in sinking on the ledges, it will surpass anything yet discovered in California, and others say, on this coast. I cannot conceive of ledges being located more favorably for cheap, easy development and economy of reduction. I am not writing this for any other object than to give you correct information on a subject, in which you have always manifested a lively interest. There are 1,200 feet in the Big Central; an average of the ore shows \$140 per ton, three feet from the surface. There are four veins on the Central ground, all showing good ore. A new hotel is being erected, and other evidences of increased activity are manifest, where stagnation has heretofore reigned supreme. Old Shasta, containing the most poverty-stricken population of any county in the State, will yet wear the laurel wreath, inscribed with that magic word "Excelsior."

Appeal Fees in the Patent Office.

The bill which has now passed both the House of Representatives and the Senate, imposing a fee of ten dollars on all applicants for patents who appeal from the decision of the primary examiners to the Board of Examiners-in-Chief, has given very general dissatisfaction to inventors. The advocates of this bill, among whom have been some of the higher officers of the Patent Office, have urged its necessity for the purpose of reducing the number of appeals taken on merely frivolous objections, and, by preventing the time of the examiner-in-chief from being wasted in examining such appeals, permitting better attention to, and more prompt action on, those which are better entitled to consideration. In opposition to this ground it is argued that, as the great amount of business which must come before the board precludes the possibility of their joint action on the majority of applications, and renders it necessary for each case to be decided by one examiner with the mere nominal concurrence of his associates—the board being a board in name only—the number of examiners might be increased to meet the requirements; and that to impose an additional fee on all appeal cases is to tax inventors unnecessarily and unjustly, more especially as the receipts of the Patent Office have been for some time past largely in excess of the expenditures.

While the fee of ten dollars required by the bill may be considered as an unjust tax upon those inventors who are compelled to appeal from the erroneous decisions of the primary examiners, and who ought not to be compelled to pay for the errors of the Patent Office, we do not think it sufficiently large to prevent many appeals from being taken on frivolous grounds. It would be better, if any restriction on appeals be necessary, to impose a large fee—say twenty dollars—on the hearing of the appeal, and allow it to be used as the balance-fee required on the issue of the patent in all cases in which the decision may be in favor of the applicant.—*American Artisan.*

COST OF SURVEYS IN CALIFORNIA.—The Secretary of the Interior reports to the House that the cost of the survey of land in California up to the present time is \$1,314,500, and the proceeds of all sales of land \$520,765. Rather an unprofitable business for Uncle Sam.

MINING IN ARIZONA.

We are indebted to Mr. John A. Mehon, one of the pioneer miners of Arizona, for the following detail of mining operations in that Territory. Nearly all the mining now going on there is in the northern part of the territory, and mostly within a radius of about thirty miles of the city of Prescott, which is now the capital of Arizona. The number of mills in operation or in course of construction is seven, as follows:

Smith & Christy's 6-stamp steam mill, located on the Sterling lode, in Quartz Mountain district, about six miles southwest from Prescott, was started the day before our informant left. It has Moore's amalgamators, with copper plates. The plates had been cleaned off, giving a promising show of gold.

The Vicksburg steam-mill, owned by the Philadelphia company, with a battery of twenty stamps, is now being erected on Bully Run lode, Turkey Creek district, about twenty-five miles southeast of Prescott. It will be in operation some time next month.

The Woolsey mill, with six stamps, and Moore's patent amalgamator, on the Woolsey or Aquon Frio Ranch, is now about ready to start. It is distant from Prescott about twenty-five miles east. It will reduce gold ores from the Green Tree and other lodes in the vicinity, and will run by water-power.

Charles Borger probably has his mill running by this time, in Big Bug district, and will reduce ores from the Big Bug lode. It is a 10-stamp steam mill, with pans, and said to be well constructed. Its location is fifteen miles southeast of Prescott, on Big Bug Creek.

What is known as the Lamson mill, is probably in running order by this time. It is a "Thunderbolt Crusher," and pans are to be used in connection with it. The mill is located in Walker's district, twelve miles southeast of Prescott, and will crush from the Lawrence, Florence, Brooklyn and other lodes in that district. There is another mill belonging to the same company which is probably on the ground by this time, and which it is designed to put up on the Chase lode, Hasyampa district, twelve miles south of Prescott.

Coulter, Tyson & Co. expect to have their 10-stamp steam mill in operation, in Walker district, by the latter part of last month. The site selected is about two miles southwest of Lamson's mill. It is the intention of the proprietors of this mill to do custom work, in addition to crushing from their own mine, the Eureka. Experienced men are engaged in this enterprise, and success is confidently anticipated.

The Vulture mill, at Wickerburgh, is still running on rock from the Vulture lode, and is said to be doing well. It is a steam mill, with Bath's patent amalgamator. Wickerburgh is about sixty miles southwest from Prescott.

In regard to the facilities for working ores in the section of Arizona situated about Prescott, our informant says that wood, water, and grass is abundant for all needed purposes. All the mines mentioned, with the exception of those at Wickerburgh and Aqua Frio, are within the region spoken of, and all in the same range of mountains. The mountains are heavily timbered with pine and oak; this is particularly the case in Walker's district.

Most of the rock contains considerable free gold, although some of the mines are heavily charged with sulphurets, while some carry galena and zinc; but the latter, especially, are few in number. The great difficulty heretofore encountered in working these mines has been the presence of hostile Indians; but they have done but little damage of late, nearly all having made treaties of peace, and are now living at Fort Goodwin. The high prices of provisions, and lack of mail facilities, have also been a great drawback in times past; but as the mails are now in the hands of a new contractor, it is thought that they will soon be delivered with a remarkable degree of regularity. Provisions are also becoming cheaper, and a brighter day for Arizona is now evidently dawning.

The depth of the shaft on the Vulture lode is eighty feet, developing good ore. The shaft

on the United States lode in Yavapai district is down seventy-five feet, showing a 9-foot vein of excellent ore. This district, not before mentioned, is about eight miles southwest from Prescott. This ore is an argentiferous galena, carrying also gold, averaging about sixty dollars to the ton. About 600 pounds of ore from this lode will probably arrive here on the next steamer from Los Angeles. There are about thirty-five tons of ore at the mouth of the shaft. Arrangements will soon be made for erecting furnaces, etc., for working this ore on the ground.

The Florence lode has a shaft forty feet deep, showing a 10-foot vein of very good ore—gold. Besides the gold ore, there is a thin stratum of ore containing argentiferous galena.

Our informant expresses the belief that there is no mine yet opened in this portion of Arizona to a depth of thirty feet, which does not contain ore of a fair paying quality.

But little, if anything, is now being done with the mines on the Gila, in the southern part of the Territory, where a large amount of expensive machinery is now lying idle. The reason of this suspension of work is mainly owing to the disturbed condition of Northern Mexico, through which most of the supplies for these mines must come. The mines there are, undoubtedly, valuable, and will, eventually, be worked at a profit. With the exception of the Mowrey mine, the Southern mines are not so well supplied with wood, water and grass, as those about Prescott.

CHEWING GUM.—To say that "chewing gum," which many children are so fond of, is one of the products of petroleum, would provoke a smile of incredulity from the uninitiated; yet, such is in all probability the fact. It is, at all events, the product of albertite, a variety of coal, the origin of which is attributed to petroleum. Many tons of chewing gum are manufactured in Portland, Maine, from the albertite of New Brunswick. Petroleum, or coal oil, is also manufactured from the same coal, one ton of which yields about one hundred gallons of crude oil. It is from the paraffine, which is extracted from this oil, that the gum is made. In fact, the chewing gum, as it is called, is nothing more or less than paraffine purified, until it resembles the finest wax. Our young friends who are in the habit of chewing this article need not feel any uneasiness lest they have put that in their mouths which is unclean, for such is not the fact. This chewing gum, notwithstanding the source from whence it is derived, is altogether clean, colorless, tasteless, inodorous and harmless, and is as much superior in cleanliness and every other desirable quality to the "filthy weed" which many gentlemen of mature growth love so well to masticate, as any one thing can be to another. We have said that chewing gum was white and colorless; it is so when first manufactured; but before being offered for sale it is variously colored and flavored.

WHAT CONSTITUTES A BARREL.—An important question has recently been settled by one of the New York courts, determining the legal size of a barrel. A purchaser contracted for 100 barrels of petroleum at nine dollars per barrel, but sent to the well barrels which considerably overran forty-two gallons each. The producer filled eighty-five barrels of these, making 4,200 gallons; one hundred barrels at forty-two gallons each; but declined to fill any more. He was sued for the fifteen barrels claimed. On the trial it was claimed that the act of Assembly provided that 31½ gallons make a barrel, and that no custom, nothing but express agreement between the parties, could reckon a barrel at more. Consequently, the claimant, instead of recovering his fifteen barrels as sued for, was compelled to account for the excess of 4,200 gallons, over 100 barrels, reckoning each barrel at 31½ gallons.

A curious invention is going to be tried in Paris. An iron tube is to be run up the side of those trees in the public gardens which require constant watering in summer. Up this tube water is to be forced, so as to produce an artificial shower when needed.

Mechanical.

COLUMNS OF STEEL.—In France a few experiments were made some time ago by M. G. I. Love, upon small pillars made of Turgot's steel, and having round ends. These pillars were one centimetre or 0.39 inches in diameter, the lengths being ten, twenty, and thirty times the diameter. The steel of which the pillars were composed, was found by experiment to have a tensile breaking strength of 108,500 pounds per square inch. According to *Engineering*, the results show that, as in the case of cast and wrought iron, the resisting power of steel to compression decreases as the proportion which the length of the column bears to the diameter is increased; but this decrease in strength does not seem to be so rapid as in the case of the two first mentioned materials. M. Love's own deductions are, that steel and cast iron columns, having a length of from one and a half to five diameters, offer about the same resistance to compression; whilst columns of wrought iron of the same proportions, offer only about half such resistance. When the length of the columns is increased to ten diameters, however, he considers that steel offers a greater resistance than cast iron, in the proportion of 41 to 31, the proportionate resistance of wrought iron being represented by 17. As the proportion of length to diameter increases, the resisting power of cast iron diminishes more rapidly than that of wrought iron, and that of wrought iron more quickly than that of steel, so that when the length reaches forty diameters, he estimates the strength of similar columns of the three materials to be in the proportion of the numbers 375, 562 and 1,500. It is wrong to found a law upon so few experiments; but if the data above given are confirmed by future trials, steel will prove a valuable material for resisting compression.

AN ANCIENT REVOLVER.—I saw in the historical collection of Dresden an object of great interest. It was a perfect revolving pistol, more than two hundred years old; and no antiquated, half-made, rough, rudimentary affair, either, but as thoroughly finished a pistol as were the Toledo and Damascus blades of older date. It was of about the same size as a Colt's revolver, and not only were the revolving barrels of precisely the same structure, size and shape, but they were six in number. The only point of inferiority was that in this there is no spring to bring up the next barrel when one is fired. It must be done with the hand. But this is a little thing, and could have been easily remedied. Colonel Colt was shown this pistol when in Europe, shortly before his death. The same gentleman exhibited it to me, and told me he never saw a more expressive face than Colt's, when he saw his own invention applied more than two centuries ago. Of course the lock was flint, and yet, being what is known as a revolving lock, it was packed away in a very small space, and the whole aspect of the pistol was as neat and attractive as any modern revolver. There is also another firearm still more interesting—it is a Whitworth gun, perfect in every respect, excepting that the bore is square, instead of six-sided. True, it is not, that there is nothing new under the sun?—*Cor. Springfield Republican.*

AN ANCIENT STOVE.—The oldest stove, probably, in the United States, is one which warms the hall of Virginia's Capitol in Richmond. It was made in England, and sent to Virginia in 1770, and warmed the House of Burgesses for sixty years before it was removed to its present location, where it has been for thirty years. It has survived three British monarchs; has been contemporaneous with four kingly monarchies, two republics, and two imperial governments of France. The great Republic of America has been torn by intestine strife, the breaches partly healed, and still the old stove remains, unmoved in the midst of all.

HONORS TO MECHANICAL ENGINEERING.—At the commencement of the University of the City of New York, held on the 21st at Niblo's Garden, the degree of Doctor of Physical Science (*Doctor Physicis Artibus*), was conferred upon Mr. Erasmus W. Smith, the well-known engineer of Harlem Bridge and of various corporations. Mr. Smith is also superintending the construction of the Dunderberg for the Government contractor, Mr. W. H. Webb. This is the first instance of the conferring of this degree in the country.

It is stated that New Haven is the only place in the United States where fishhooks, needles, and steel-bow spectacles are manufactured. Needles, however, are now made in Bridgeport and other places.

A NEW HAVEN company has begun the manufacture of a compressed stone for building purposes. It is made of sand, pulverized quartz, and silicate of soda, and hardens within twenty-four hours from the consistency of putty to the solidity of stone.

CLEANING HORSES BY MACHINERY.—At the establishment of the Manchester Carriage Company, Peadleton, England, there is in practical operation, a novel and ingenious system of cleaning horses by means of a steam brushing machine, invented by a Mr. Haworth. In the lower stableyard there is a large shed, where ten or a dozen horses can be cleaned at one time. Along the center of the roof is a revolving shaft, from which hang several endless straps. Each strap gives motion to a horizontal pole, at one end of which is a conical brush that rotates rapidly. On an omnibus horse being brought into the stable, after his three hours' work, he is taken to this shed and a man applies to him the machiac brush. In about half an hour the animal is thoroughly cleaned, and only the head requires finishing by hand. This cleaning effected by the machine is much more searching and effectual than the most diligent hand currying can possibly be, and to the majority of animals the greater cleanliness of their skins, as well as the improved circulation of the blood which is produced by this machine brush, appear to be acceptable. Most horses undergo the operation quietly and patiently; but in some animals timidity is produced by the rattle of the machinery. The most important result of the adoption of this invention is the economy of labor which results from it. Under the old system a man was thought to have done a fair day's work if he cleaned ten or a dozen horses, but by this machine he can clean thirty in the same time, and with considerably less heavy labor.

HARD HYDRAULIC CEMENT.—The following receipt is given for a cement which it is said has been used with great success in covering terraces, lining basins, soldering stones, etc., and everywhere resists the filtration of water. It is so hard that it scratches iron. It is formed of ninety-three parts of well-burned brick, and seven parts litharge, made plastic with linseed oil. The brick and litharge are pulverized; the latter must always be reduced to a very fine powder; they are mixed together, and enough of linseed oil added. It is then applied in the manner of plaster, the body that is to be covered being previously wet with a sponge. This precaution is indispensable, otherwise the oil would filter through the body and prevent the mastic from acquiring the desired hardness. When it is extended over a large surface, it sometimes happens to have flaws in it, which must be filled up with a fresh quantity of the cement. In three or four days it becomes firm. If its advantages have not been overrated it must be a very excellent cement for rendering the joints of aquariums water tight.

OIL FOR FUEL.—A series of important experiments upon Mr. Richardson's method of burning mineral oil as a fuel for steamships, and also as fuel for steam-engines, was lately terminated at Woolwich Dockyard, England, with complete success. Ten pounds of water is the highest quantity that has ever been evaporated per pound of the best steam coals; upwards of eighteen pounds of water has now been evaporated continuously for many hours by oil from the celebrated Torbaux-hill or Boghead mineral. The trials with other rock oils, though not reaching quite so high a figure, have been such as to prove the superiority of mineral oil over coal, and the perfect capability of maintaining the strongest fire without the slightest cessation or diminution of its intensity until the complete exhaustion of the stores of fuel.

A STEAM CARRIAGE ON BROADWAY.—Persons who were on Broadway yesterday afternoon were surprised by the appearance on that thoroughfare of a vehicle propelled by steam. The carriage was about eight or ten feet in length, with iron wheels, and had two seats lengthwise, with comfortable cushions and backs. It was occupied by half a dozen men, and was operated by one man, who acts both as engineer and guide. There was very little noise, and nothing to denote its speciality except the absence of horses and a small smoke-stack, about a foot high, at the forward end. The stack resembles an ordinary stovepipe. The carriage was turned into Grand street with apparent ease, and that street being less obstructed by vehicles than Broadway, it was driven at the average speed of a horse-car.—*N. Y. Post, June 13.*

ENGRAVING ON GLASS.—Engraving upon glass has hitherto been, not unfrequently, effected by the use of fluorine acid, which often produced dangerous wounds, when by accident it came into contact with the skin of the workmen. Mr. Henrie Sainte-Claire Deville has recently exhibited to the Academy of Sciences of Paris some very fine examples of glass engraving executed by means of a solution of the fluorides of calcium in hydrochloric acid, with which there is no such danger. The results obtained by this method are said to be exceedingly satisfactory.

Scientific Miscellany.

INFLUENCE OF CLOUDS IN PHOTOGRAPHY.—It has recently been discovered that clouds exercise an important influence upon photographing scenery. It is shown that views, when taken beneath clouds does not reproduce distant details, as for instance the foliage upon distant hills, or the smaller stones or other objects lying upon the ground. The magnifying glass when applied to photographs of distant scenery, taken beneath overhanging clouds, reveals only a bare, hazy surface, while those parts of the same picture above the clouds, as for instance, the mountain tops, reveal even the minutest detail at the distance of several miles. Photographs of the Peak of Teneriffe, by Prof. Smyth of England, a portion of which was beneath the shadow of a cloud at the time it was taken, exhibit this fact in a most marked manner. On the parts at high elevation, above the cloud-shadow, and consequently most distant, every little bush is shown, under a magnifying-glass, to be distinctly depicted, with its leaves and stems, even to the distance of four and a half miles from the camera.

A POWERFUL MICROSCOPE.—The most powerful microscope ever constructed, has been made by Messrs. Powell & Lealand, and described in a paper read before the Royal Society of London, England. The power of this instrument is fully double any which had ever been constructed previously, and altogether surpasses what had before been considered the utmost attainable limit of perfection in this instrument. This powerful microscope magnifies 3,000 diameters with its lowest eye piece, and 15,000 diameters with its piece of the highest power—the latter being equivalent to magnifying no less than 1,575,000,000, or making an object appear that number of times larger than it really is! How immensely must such an instrument increase our knowledge of the lower organisms; may it not even enable us, eventually, to determine the ultimate constitution of matter; it must, at least, greatly aid the scientist in his researches in that direction.

CURIOS COMBINATION OF LIGHT.—By means of the stereoscope, Professor Rood, of Columbia College, has recently been studying the combination which takes place when light of different tints is presented to the right and to the left eye. He confirmed, what has already been announced, that when differently-colored glasses are held before the two eyes, a combination of the two tints takes place in the brain, the resultant impression being the same as is produced by mixing the two tints together, and presenting the compound to the single eye.

COST OF WAR.—Professor de Candolle, at the horticultural banquet in London, recently, drew attention to the flourishing condition of science in countries with a free political system, and said that with a day's pay of the millions of soldiers massed on the continent, a conservatory might be erected from Paris to Berlin. Instead of meeting with nothing but the "blood-red blossoms of war," through that distance, we might roll along over a thousand miles through a perfect garden of the choicest and most fragrant flowers.

UNDER the name of "mineral ether" a very pure and useful article has been introduced into commerce. It is free from all disagreeable smell, volatilizes perfectly, leaving no odor, and removes grease stains most effectively.

SCIENTIFIC investigations show that in ascending mountains, the heart-beats increase on an average of one per minute for every hundred yards of ascent.

THE photographic power of the sun is due to the presence of netlike or invisible rays. It is not the light that paints the solar picture.

PLANTS WITHIN PARTS OF PLANTS.—Some observations appear to show that plants are sometimes formed within the cells of plants. In the cambiums of the cedar and the potato cells have been observed containing small tetrahedral bodies, which were gradually transformed into minute plants.

LEAD POISONING.—Poisoning by drinking water which has acted on lead happens far more frequently than is often suspected, and the mode in which the water is rendered poisonous is frequently difficult of discovery. A correspondent of the London *Times* states that, from a rural parish where the drinking water is got from draw-wells, and where are neither leaden pumps nor leaden pipes to contaminate the water, several of the peasantry went lately to the neighboring county infirmary, suffering from lead poisoning. Careful investigation led to the discovery of the source of the evil—in the so-called "tinned" kettles in which the water used for tea and for cooking was boiled. It was ascertained that the "tin" with which the kettles were lined was an amalgam of tin and lead. The adulteration of tin with lead is one of the most common frauds. It is of very great importance to public health that some way of escaping from poisoning by leaded tin should be discovered, and it would be desirable that we should know whether there is any coating for iron which would resist heat and the ordinary action of water, and which could be substituted for what is called "tin." About a year ago a French patent was taken out for such a coating, and the coating is said to have stood very severe tests of heat and acids. Such a coating has also been discovered lately in England. Any one giving accurate information respecting such coatings would confer a boon upon the public.

SINGULAR EFFECTS OF ELECTRICITY.—The following remarkable effects of the fulminating power of hodies recently struck by lightning, have recently been communicated to the Paris Academy of Sciences: "On the 30th of June, 1854, a man was killed by lightning near the Garden of Plants, at Paris; the body remained for some time exposed to a pouring rain. After the storm, two soldiers, in attempting to lift up the body, received two violent shocks. In the other case, which occurred at Zara, Dalmatia, two artillerymen who had been ordered to set up again in their former places two telegraphic posts that had been thrown down during a storm, took hold of the telegraph wire. Although it was two hours after the storm, there was so much electricity left that the man first experienced a few slight shocks, and then was both thrown to the ground. The hands of both were scorched, and one of them did not even for a time show any signs of life. The other, in attempting to get up, sank down again, and in so doing touched a comrade, who was coming to his assistance, with his elbow. The third man was then thrown down in his turn, experienced various nervous effects, and his arm was marked with a burn at the spot where he had been touched by the other man's elbow.

HOW TO TEST THE PRESENCE OF LEAD IN WATER.—A very ready test for lead in water consists in taking two tumblers and filling one with water which is known not to have been in contact with lead; the other being filled with the suspected water. Dissolve in each about as much bichromate of potash as will stand on a dime. By daylight the water in each tumbler will be of the color of pale sherry and water. Cover the tumblers so as to keep out dust, and let them stand in a warm place in a room with a fire in it for twenty-four hours. If the suspected water be free from lead, it will have the same color as the other, but if there be lead in the water it will have a more or less opalescent tint, as if a drop or more of milk had been put into it. If there be a great quantity of lead in the water, a very slight film of lead will be deposited on the glass.

USE OF GLYCERINE FOR MOISTENING MODELING CLAY.—Cosmos records some experiments on the use of glycerine instead of water for moistening modeling clay. Clay, first well dried and then rendered plastic by admixture with glycerine, was kept in a hot room for two months, at the end of which time its plasticity had not in the least diminished. Clay rendered plastic by glycerine would seem to be capable of being used over and over again indefinitely, just like wax: with the advantage over wax of always retaining the same consistency and degree of plasticity, neither being hardened by cold nor softened by heat.

THE PRESERVATION OF SULPHATE OF IRON.—Signor Pavesi recommends the following method of preserving sulphate of iron from oxidation: Mix four parts of pure crystallized sulphate of iron, and an equal quantity of finely-powdered gum arabic, with distilled water, and evaporate the solution in a water-bath, at a low heat, till it has a sufficient consistency to be poured out on plates of glass. When it has been poured out in this way, and allowed to dry at a temperature of thirty degrees cent. in the dark, it may be cut up into lozenges, which can be kept for any length of time in a colored stoppered bottle.

BEAUTIFUL IDEA.—The death of the body no more interrupts this life of the soul than the breaking of a crystal glass destroys the sunbeam that shone so brightly on it.

SALES OF THE WEEK

SAN FRANCISCO, SATURDAY MORNING, August 11th, 1866.

There is more activity in the Money Market, without, however, any appearance of stringency. During the past sixty days the shipments of treasure to New York, England, China, etc., have amounted to \$9,250,000; and the receipts from domestic sources, including coin, have not exceeded \$8,000,000. If the shipments of coin to the interior be added to our exports, the aggregate drain upon our resources for the past two months will be fully \$2,000,000 in excess of the actual receipts of gold and silver. In other words, the production of the precious metals has been twenty per cent. less than the demand for commercial purposes; involving, also, the loss of considerable sums of coin. The effect of this is, we think, already apparent in some quarters, and if the export demand for bullion does not soon materially fall off, a less easy money market may be reasonably anticipated the ensuing summer and fall. Rates of interest still rule at 1@1½ per cent. per month in bank.

We learn that a dividend of 1 per cent. has been declared upon the capital stock of the Bank of California for the month of July.

Receipts of Treasure from the interior mining districts since the date of our last reference, amounted to some \$900,000. The Sub-Treasurer in this city has shipped East, since January 1st, \$6,500,000 for Government account.

The market is well supplied with Bullion, and the shipping requirements less active than for some time past. Gold bars are selling at \$60, and even lower figures are reported. Silver is quotable at about par for round lots.

Currency bills on the Atlantic are offered at 42 per cent. premium on gold. Sight drafts, payable in coin, are selling at 2½ per cent. premium, and the rate for Telegraphic Transfers has been advanced to 4 per cent. premium. Sterling may be quoted at 48¼@48½d for best banker's bills.

Legal Tender Notes continue dull and inactive. Small sales have been made this week at 71½@72¼c; closing at the latter rate, asked. Our latest telegraphic advices from the East, to the 9th inst., quote gold at 148½.

The Mining Share market has been characterized by a fair degree of activity, and nearly all stocks were well maintained.

Hale & Norcross was dealt in at \$1,600, seller 30, closing at \$1,650 bid. The total product of the mine last month amounted to 2,739 tons of ore, and 65 per cent. of the assay value of which (required of the mills) exceeded \$141,000. A dividend of \$75 per foot was declared yesterday for the month of July, leaving \$50,000 surplus at the credit of the company. In drifting east some 125 feet from the shaft, on the 400-foot level, a promising seam of pay ore has been found.

Savage has continued to improve, advancing from \$1,030, ex-dividend, to \$1,085, buyer 30, then selling at \$1,190, and closing at \$1,200. During the week ending the 4th instant, 901 tons of ore were extracted, and 766 tons shipped from the mine. The cost of producing this ore is estimated at \$9,034, and its reduction at \$12,315, leaving an approximate profit of \$15,000 for the past week. The balance at the credit of the company, after the payment of the last dividend, is said to have been at least \$35,000.

Amount of sales.....\$ 82,569 00

Thursday, August 9.

Crown Point was sold at \$1,000@885, closing at \$925 asked. During the past month 1,649 tons of ore were reduced as follows: At Petaluma mill, 143½ tons; Marysville, 552; Golden Eagle, 505; Winfield, 143, and at the Crown Point 200 tons. The Rhode Island Mill is expected to be in operation on Monday next. Some 100 tons of ore per day are now being hoisted from the lower works.

Gould & Curry rose from \$700 to \$730, and receded to \$715. There is nothing new from the mine worthy of especial mention. The reserves in the upper level still hold out well.

Yellow Jacket advanced from \$680 to \$702½, receded to \$650, and rallied to \$660, seller 30, then was dealt in at \$650@660, closing yesterday at \$702@722. The product of ore last month amounted to 8,286 tons of second-class, and 28 tons of first-class. Some 8,450 tons second and 5 tons first class ore were worked, yielding in the aggregate \$281,706. The entire disbursements for July were \$201,826.93, leaving a net profit of \$79,889.66.

Ophir has been tolerably well maintained, receding from \$270 to \$260, then selling at \$265@262, and changing hands yesterday at \$265@272. The body of ore on the 9th gallery is diminishing rapidly but in stooping from the 3d floor of the 8th station the indications are more promising.

Chollar-Potosi is in rather less favor, dropping from \$182½ to \$170, rallying to \$174, and selling yesterday at \$180, buyer 5. The Santa Fe station is said to look very well, and is producing some good ore. The Belvidere continues to yield 25 tons of good ore daily. Operations below the Potosi tunnel have been temporarily suspended, in order to repair the Potosi shaft. The various drifts from the New Shaft are said to present no "encouraging features" as yet. During the week ending 4th instant, 831½ tons of ore were sent to custom mills.

Belcher has been active within a range of \$155@140, closing at \$149. Alpha rose from \$90 to \$105, fell to \$95, and closed at \$95 bid.

Empire Mill continues to be strongly held, and small sales were made at \$115 per share. At a depth of 190 feet from the surface, in drifting westward from the shaft some 70 feet, a body of good ore forty feet wide has been met with, which is at present yielding 75 tons per day to the Company's two mills. In drifting east 35 feet, and west 85 feet, at a depth of 685 feet, promising deposits of ore have also been found recently. The Company carried forward a surplus of \$16,000 at the beginning of this month, and the production of the mine will probably be materially increased in the future.

Imperial advanced from \$95 to \$99, dropped to \$94, and was dealt in yesterday at \$94 asked. There are no tidings this week from the mine. A dividend of \$6 per share was declared yesterday.

Overman has not fluctuated materially, and about 700 shares were sold at \$36@40½, closing at \$39 per share. Bullion is in less request, dropping from \$38 to \$25, seller 30, rallying to \$27½, and selling yesterday at \$25.

Confidence has improved a little, and small sales were made \$45@50, closing at \$50.

Daney was dealt in at \$5½@5¼, and Sierra Nevada \$2½@3¼. Fireman's Fund was sold at \$113 per share. California Steam Navigation rose from 75 to 80 per cent., closing at 80.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday, amounted to \$404,672.

San Francisco Prices of Copper Ores.

SAN FRANCISCO, Aug. 11, 1866.

We give the following as an approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent :

12 per cent. ore.	Per ton.	22 per cent. ore.	Per ton.
12 " "	22 50 " 3	18 " "	49 00
14 " "	24 00 " 4	19 " "	51 75
15 " "	27 00 " 5	20 " "	54 50
16 " "	29 75 " 6	21 " "	57 25
17 " "	32 50 " 7	22 " "	60 00
18 " "	35 25 " 8	23 " "	62 75
19 " "	38 00 " 9	24 " "	65 50
20 " "	40 75 " 10	25 " "	68 25
21 " "	43 50 " 11	26 " "	71 00

These prices, we believe, will be found substantially correct, and can be realized at this date.

Judicious Resolutions.

Several of our most substantial and judiciously managed mining corporations have passed resolutions, since the approval of the new assessment law, requiring all notice of assessments and sales to be published in the Mining and Scientific Press, the only thorough (daily or weekly) mining journal on this coast. Our efforts to concentrate all mining advertisements in one paper, for the economical convenience of shareholders and assessment payers, are meeting with decided success. Those who believe in supporting the mining cause, should bear our paper in mind, and bring up this subject at the next trustee or shareholders' meeting.

San Francisco, April 7th, 1866.

Preparing for Publication.

A complete History and Directory of the Central Mines of Colorado.

Central Mines of Colorado.

And the towns and cities in their vicinity.

PERCEIVING THE GREAT ADVANTAGE TO COLORADO a pamphlet, historical and descriptive of its central and most important mines would be at the present time, the subscriber has undertaken to publish such a work.

It is designed to fix for the future the discovery and early history of the mines, to sketch their progress and present condition, to give such statistics as are attainable with regard to their production, actual and possible; in fact, to disseminate throughout the East and in Europe accurate information respecting them. To relieve the tedium of such a work, interesting incidents illustrating the early manners and customs of the pioneers, and the gradual organization into its present existence of the first and always to be the eminently Rocky Mountain State, will be given.

It is also designed to contain a complete Directory of the towns of Central, Black Hawk, Nevada, Golden City, Idaho, Empire, Georgetown, Gold Dirt, and South Boulder; views of each of those places; separate views of the principal buildings, public and private; also views of mills and mines and of mountain scenery.

There will also be attached a Business Department, in which a limited number of advertisements will be inserted.

O. J. Hollister, of the Black Hawk Mining Journal, has been engaged to compile the body of the work—the historical and descriptive narrative. Having been here interrupted for the past six years, and mingled freely in perhaps every walk of life, he trusts he will be able to do the subject ample justice.

All old residents of this region who are familiar with the discovery and early history of the mines, or with interesting incidents of that indefinite time known as the "early day," will confer a favor on the subscriber by furnishing such information to O. J. Hollister, Journal office, Black Hawk, Colorado.

The work will be issued sometime during the month of August. Price \$2, bound in paper; in muslin, \$2 50.

Address, G. M. BINCKLEY, Central City, C. T.

By Express.—Two cents per copy will be added to our usual rates of subscription (to pay Wells, Fargo & Co.'s tariff) on papers sent by express. If connecting express in the interior make additional charges, subscribers must themselves settle the same.

JOB PRINTING

—FOR—

THE PEOPLE!

Mining and Scientific Press

JOB PRINTING OFFICE,

505 Clay Street,

(Southwest corner of Sansome street, on 2d floor.)

Formerly WATERS BROS. & CO.'S.

We are now prepared to offer customers the most favorable inducements to patronize our Book and Job Printing Establishment. Our office is supplied with an extensive assortment of Type, and the best style of Presses for good work and

CHEAP AND RAPID PRINTING.

Patrons will always find us well up to the times, ready to execute superior work, and furnish the same as cheap as any prompt and reliable firm in San Francisco. Our aim is to suit our customers in regard to style and price, and will guarantee entire satisfaction to every reasonable individual who may be kind enough to bestow upon us his patronage.

We give special attention, when desired, in assisting parties in making up or revising their copy. Particular care will always be given to the publication of

LAW BRIEFS, CERTIFICATES OF STOCK, MISCELLANEOUS BLANKS, BLANK BOOKS, MINING BLANKS,

BOOKS, PAMPHLETS, CARDS, CIRCULARS, MINING REPORTS.

Orders from the interior will receive prompt attention. We shall take care to secure correctness in all work executed for parties out of town. Small packages can be forwarded by mail at small expense.

City customers, or persons visiting San Francisco, are invited to call and examine our specimens, when they will be politely informed of our prices by the Proprietors.

DEWEY & CO., Proprietors,

Mining and Scientific Press Patent Agency, Newspaper and Job Printing Office,

505 Clay Street, San Francisco.

A. T. DEWEY. W. B. EWER. C. W. M. SMITH.

Pacific Mail Steamship Co's

THROUGH LINE TO NEW YORK,

Carrying the United States Mail.

LEAVE FOLSOM STREET WHARF, AT 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers for ASPINWALL for NEW YORK.

On the 10th, 18th and 30th of each month that has 30 days.

On the 10th, 18th and 30th of each month that has 31 days.

When the 10th, 18th and 30th fall on Sunday, they will leave on Saturday preceding; when the 18th falls on Sunday, they will leave on Monday following.

Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.

Departures of 14th or 18th connect with French Transatlantic Co.'s steamer for St. Nazaire, and English steamer for South America.

Departure of 10th connects with English steamer for Southampton, and P. R. Co.'s steamer for Central America.

Departure of the 30th connects with English steamer for Panama, the port of the Panama Railroad.

The following Steamships will be dispatched on dates as given below:

August 15th—SACRAMENTO. Capt. J. M. Gavarly.

August 30th—GOLDEN AGE. Capt. E. S. Furnessworth.

Connecting with NEW YORK, Capt. Brandy.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Inman Line, can be obtained at office P. M. S. S. Co., San Francisco.

For Merchandise and Freight apply to Messrs. WELLS, FARGO & CO.

The splendid steamship COLORADO will be dispatched for CHINA on TUESDAY, January 1, 1867.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Loldesdorf streets.

OLIVER ELDREDGE, Agent.

FAIRBANK'S

RAY, COAL, CATTLE, MINERS', AND GROCERS' Scales.

We would call the attention of Miners to our large scales for weighing loaded wagons, of from 10,000 to 20,000 lbs capacity.

EXTENSIONS OR REISSUES OF PATENTS

Already granted; will act as Attorneys in presenting Applications at the Patent Office, and in managing them to a final issue; will draw up Assignments; will examine into the condition of Rejected Applications when desired to do so, and undertake the prosecution of such as may be considered patentable, and do whatever else is

Mining Summary.

CALIFORNIA.

Alpine County—

From the *Alpine Miner* of August 4th, we clip these items: Messrs. Kustel and Zunny have made arrangements to work George Washington ore, as well as the ore from the Morning Star. The mill will be in running order, with furnaces, etc., in from six to eight weeks. A sample of ore now before us, from the American mine, shows no portion of the vein stone but is literally a mass of ore; copper predominating by weight, but the black sulphurets of silver forming so large a portion as to insure its going well up in the hundreds in the precious metals. At this mine an engine and hoisting works will be put on soon to sink a permanent working shaft to strike the lode about a hundred feet deep on the dip. The Sonoma company's shaft is now down ten feet. The shaft on the I.X.L. lode is down sixty feet. They will send pay ore to the mill. On the first of August the Morning Star mine passed into the hands of Messrs. Kustel & Zunny, who have entered into a contract to take out 10,000 tons of ore at their own cost, and pay the company for the same at the rate of \$17.50 per ton, with the privilege of another lot of 10,000 tons on the same terms.

The people of this county have discovered that the secret of their small returns, while assays of the same ore were constantly showing it good, is that the ores contain so large a percentage of copper and other base metals as to be entirely unmanageable by the ordinary pan process of amalgamation. The *Union* says: "There are parties now here who, we believe, understand their business, and who assure us the working of their ores by roasting and the Frieburg process will prove a success, and with our facilities for fuel and water-power need not be too expensive for even a common class of ores. Roasting and barrels, or smelting, will effect something for Alpine, and the time is near at hand."

Amador County—

The *Ledger* of the 4th instant has these items: No mine in Amador county shows more flattering prospects than the Golden Gate. Two tunnels are being run into the hill along the ledge, and we were shown some rock taken from the upper tunnel a few days since that for richness we have seldom seen equaled, if ever surpassed. The distance from the mouth of the tunnel where this rock was taken out is probably about one hundred and fifty feet. The ledge there is about 2½ feet wide—the rich streak being some eight or ten inches in width. Dr. Veatch, a gentleman of much experience in the working of sulphurets, is now erecting the necessary machinery, and will soon commence operations at the Oneida mill. Last week we said that Meader & Co. had "leased the Coney mine." We should have said that they had leased the mill and contracted for all the rock taken out of the mine for one year. Mr. Ambler is now engaged in putting in additional machinery, and will soon have the mill in perfect order for working the rock and sulphurets.

Butte County—

The *Record* of the 4th inst., says: Forhestown is making progress. The quartz mill of Messrs. Parks & Platt, will, we understand, commence crushing on Monday, with all the modern improvements. Their lode is a rich and extensive one. There are other ledges in that vicinity, which are being prospected and prepared for working. Messrs. Plum, Harris, and Maddox & Flint, and others, are at work on ledges with a view to the erection of mills. A vast bed of iron has been found outcropping in this county. Parties are now at work upon it, and in a short time we shall be able to make a full and correct report concerning it. From present information, it is believed that the county has ore sufficient to furnish iron for the Atlantic and Pacific railroad. Specimens already in hand yield about 90 per cent.

A correspondent of the *Marysville Appeal* speaks of Oroville in the following words: "The neat white cottages have been abandoned or removed. The streets which were trodden daily by thousands are to-day as green as a clover field."

Calaveras County—

The *Courier* of 4th inst., has these items: Work has been resumed in the Hardy mine, Murphy's. The workmen in the Buckfield copper claim, situated near San Andreas, have laid open a lead two feet wide. We learn that the lead in the Antelope mine continues to improve the deeper the shaft goes down.

The *Chronicle* says: At Railroad Flat, Post & Co. have had more rock crushed at Harris' mill, since our last issue, which averaged fully equal to their first crushing—\$40 per ton. The utmost activity prevails among the quartz miners in that region.

The *Register* has the following: Eighty tons of rock from a claim near West Point, a few days ago, yielded \$11,000. Very few of the veins in this vicinity have been prospected

to the depth of 100 feet. They have usually been worked until the water has rendered it necessary to erect machinery, or the rock has become hard and more difficult to work, or has failed to yield well, and then abandoned for some other discovery nearer the surface. But very many of the veins, as far as they have been worked, have proved to be extremely rich. The shaft on the Mina Rica is down about 170 feet, with a vein four feet wide from wall to wall. The Luckwood is down about 100 feet, with a vein three feet wide, and the Austrian has a shaft 80 feet deep, with a vein of two feet. The rock from these claims, or at least from the first two, yields about \$100 a ton, but the expense of getting the rock out takes a large margin from the profits.

C. T. Meader & Co. shipped over 1,200 tons of copper ore from the Union mine to San Francisco during the month of July.

Mariposa County—

The *Stockton Independent* of 4th inst., says: The first lot of copper ore, consisting of nine tons and a half, from the Ne Plus Ultra mine, Chowchilla, Mariposa county, arrived yesterday by Blanchard's team. There are sixty tons of ore at the mine ready for transportation. The ore assays about forty per cent.

Mendocino County—

The *Democrat* of August 30, has the following: It may not be generally known that Mendocino contains within its borders gold-fields probably as rich and vast as any other county in the State. During the rainy season, with but the rudest implements, men have been known to make good wages in prospecting various gulches in the vicinity of Calpella, and with sufficient water for panning purposes, there is not a shadow of a doubt that magnificent returns would be obtained for the labor and capital expended.

Nevada County—

We clip the following items from the *Gazette*: We are informed that the Mattingly ledge, situated about a mile and a half southeast of Nevada, has recently been sold to San Francisco men. We have not learned the amount paid. The ledge was mostly owned by Loutzenheizer, of Grass Valley, and Major Murdock. We learn that the Harmony company, who carried on operations quite extensively some years ago, near the head of Rock Creek, have lately made a location so as to extend their claims entirely through the ridge. They purpose now, as soon as they can make the necessary arrangements, to erect hoisting works on the south side of the ridge. The owners of the "Jim," near the head of Little Cañon Creek, owned by Hunt and others of Grass Valley, have out about 100 tons of rock, which they intend to have crushed by the Star mill. We were shown, on Saturday afternoon, two fine lots of gold dust, one taken from the claim of Binsley and others on Kentucky Flat, and the other from the Illinois Ravine claims, owned by the same parties. There was about \$5,000 in each lot, that from Kentucky Flat being composed mostly of coarse gold and specimens. The mill erected by Hawley & Bros., on the Eureka, was started upon the 6th instant. A company is now engaged in erecting works at the old Canada Hill mill, for the reduction of sulphurets by means of super-heated steam.

The *National* says the new mill of the Union Hill company, after a run of less than two weeks, crushed sufficient rock to make a handsome gold bar weighing about four hundred ounces, and valued at over seven thousand dollars.

Soon after the report in regard to the discovery of the Italian ledge became circulated, says the *Transcript*, a lady, whose house is located on the ledge, went to work in her cellar, and after digging away two weeks found the lead. The rock presents an excellent appearance, and will no doubt prove rich. For several days the lady has had two men at work taking out rock and opening the lead.

Three lumps of gold, weighing in the aggregate 539 3-5 ounces, worth \$18.50 per ounce, were the result of a run of four days and thirteen hours, in Brown & Co's cement claims, near You Bet.

Excelsior.—The *Meadow Lake Sun* says: The California company have had a general settlement; also, elected a new superintendent. The mill will again start up on Monday next. The mill of Parsons & Co., now in course of construction at the town of Carlisle, will start up next Thursday, and will crush ore from the Grant ledge. This ledge is located on Old Man Mountain, and is regarded as one of the richest in the district.

Houses at Meadow Lake for which \$100 per month was refused a month since, are now hiring tenants at \$25.

Shasta County—

The *Courier* of 4th inst., says: We understand that the workmen in the lower tunnel of the Williams & Kellinger mine have recently tapped a large stream of water, which, to some extent, interferes with their operations.

A correspondent of same paper, writes from Roaring River, July 29th: "I hear a great

deal of discussion about the South Fork silver mines, and the prospect of getting them opened. The Chicago were offered \$10,000 for their claim, but refused it, demanding \$30,000. My own opinion is, that they have rock enough in sight to more than pay the \$10,000, over and above expenses of getting it out; and the claim would then be worth more, thus opened, than at present. The same will apply to the Big Central, Ohio, Crystal, and others. Let the claims be worked so long as rock can be obtained that will pay for shipping, and when it will not pay that, why, abandon them, for they are worthless to poor men, (and I might add,) or anybody else."

Sierra County—

The *Messenger* of August 4th, says: The continued and unexampled success of the Sailor quartz company, previously alluded to, has had a salutary effect on our formerly lethargic population. We hear that several companies, located on different veins in the vicinity, have commenced work in earnest, and are now quarrying ores which they propose testing at custom mills. We have visited several of the properties alluded to; some of them show rich prospects, and in no instance have we failed in getting a good working result. We have seen a rich specimen, about the size of a man's head, from the Sailor ledge, together with smaller specimens from the same, that are full of gold. This company cleaned up after a second short run, doing better than at first.

The Good Hope boys brought down some more of their rock a few days since, in which numerous fine particles of gold are visible. We crushed a few ounces in which no gold could be seen, and found it very rich. The boys are taking out rock for a working test, which will probably be crushed next week. A friend over from Allegheny reports the finding of a rich quartz ledge in that vicinity a few days ago. Some of the rock crushed prospecting amazingly. Some new gravel diggings have been discovered on the head of Rock creek, back of the old Mount Vernon claims. The claims pay well as far as prospected. Wilmarth & Cottle, and others of Howland Flat, are working the Plymouth Rock claim at Hog Cañon, the prospects of which are very flattering, we are told. Other parties in the cañon are pounding up boulders and float rock in hand mortars and making it pay. We visited E. Hall's quartz mill a few days since, and found things working admirably. This was formerly the Wheeler mill, and contained eight stamps; four only are now running. The mill is working on Sailor rock. Considerable excitement was created a few days since near the southern portion of the county, by the discovery of petroleum in quantities that is believed will pay well. Claims were being rapidly taken up when our informant left. Forty or fifty lengths of the Magenta flume were torn down and burned one night last week. The parties engaged in this business are supposed to be the men who were lately swindled out of their pay by the sale of this property. The old mill at Gold Lake has been refitted and will soon be running. There are sixteen men employed.

Trinity County—

A letter to the *Journal* from Union Hill, July 29th, speaks of a new excitement in placer mining there. He says: We ran a tunnel into the hill forty feet, on color, and the next forty prospected from fourteen to thirty cents to the pan, and this so very uniform that it created an excitement. Everybody thought we had struck it rich, and so did we. The mountain was immediately claimed for a mile or more, and the work of shaft sinking and tunneling commenced all along the ridge.

A company of Chinamen recently purchased the claim of Mertz & Co., at Cope Horn Bar, paying a good price therefor. The boys thought they had done well, as they were unable to make more than three or four dollars a day to the hand. Soon after the Chinaman went to work it began paying from six to ten dollars to the man, and bids fair to keep doing so.

Tulare County—

The *Times* of the 4th instant says: For some days past the roads have been lined with teams, both going to and returning from our mining districts. Several very heavy laden teams with machinery for Kelso Cañon and White River passed through town the other day.

Tahama County—

The *Citizen* (late *Courier*) of August 4th, gives these items: We learn that General Darrow and son took from their claim, near Tuttle town, last week, three and a half pounds of gold. Messrs. Evans and Shanks were in town last week, and exhibited some very rich specimens from the Moore lead. On a vacant lot on State street, immediately opposite the *Citizen* office, Mr. A. Levy washed out eighteen pans of dirt, on Thursday last, and obtained \$6.50 in gold, being an average of a fraction over thirty-six cents to the pan. Twelve tons of rock taken from the Hazel Dell claim, during the past week, yielded \$360. This claim is owned by Messrs. Bacon & Co., and is located some seven miles east of this city.

They are now down about ninety feet, and have a well-defined ledge from ten inches to three feet in thickness. The company have a 5-stamp mill, with plenty of power, and are now sinking a shaft to tap the ledge at a greater depth. Messrs. Cunningham & Co. got the privilege of running a race through an unoccupied city lot, for the purpose of carrying off the tailings from their claim, agreeing to wash the dirt excavated in running the race, and allow the owner of the lot to have the proceeds. The race was completed, and the gentleman cleaned it up on Monday last. He is reticent about the matter, but is known to have obtained more than one hundred dollars.

A communication in same paper, alluding to Springfield Flat, says: There are yet many rich spots among the lime boulders hereabout, where "lucky strikes" will continue to be made for years to come. At the depth of twenty feet is a soft and spongy clay, in which are imbedded the bones of the mastodon and other animals. Some enterprising capitalist will, eventually find, far below this stratum of clay, a bed of sand and gravel, intermingled with rich deposits of gold.

Yuba County—

The *Marysville Appeal* has these items: The Jefferson company, at Brown's Valley, after a run of thirteen days, cleaned up on the 5th instant \$3,000. The Jefferson is one of the permanent mines of the State, and it is believed, after her new machinery gets in operation, that a monthly dividend of fifteen dollars per month will be declared. The mines at Brown's Valley are increasing in general favor. The Rattlesnake (Old Yuba) is at work with the best prospects. Forty-seven shares in the Pennsylvania company, Brown's Valley, sold yesterday for \$2,350, or fifty dollars per share.

NEVADA.

Washoe—

Statistics lately gathered show that the forty-six companies owning the Comstock lead have excavated about forty miles in tunnels, drifts, etc.; that there are 44 engines for hoisting and 76 for reducing ores belonging to the lode; and that 32,000 cords of wood, at \$16 per cord, are used annually.

At Bassett's mill, in Six-Mile Cañon, one hundred and fifty pounds of amalgam, which was draining in a bag, was carried off bodily by some adroit thief, while all hands were at work close by. So says the *News*.

Reese River—

The *Reveille* has these items: The new machinery of the Morgan and Muncey is of the most substantial character, and the best results are anticipated from its working. The last lot of twenty-four tons of ore from the La Platte company's mine in North Twin River District, had arrived at the Keystone mill. Seven tons of High Bridge ore had passed through Austin on its way to the Butte mill in San Francisco Cañon. It was from the claim of Dr. Geller. We were shown a beautiful specimen of copper ore from the Bolivia District, about eighty miles nearly due west of Austin. It was obtained from an immense vein of twenty feet in thickness, and is a mass of red oxide spangled with bright yellow sulphurets of copper.

The same paper has an editorial on "opportunities of capital," urging, with its usual force, the rare chances for investment which that region offers. It says: At Cortez district is the most singular instance of vast treasure lying neglected that we know, and that it should thus lie neglected is almost too much to believe. It is not only at Cortez that we can point to such neglected opportunities, but throughout the whole region, from the Humboldt to the Colorado. In every district are veins of undoubtedly great value, lying unproductive, and begging for the necessary capital to make them real mines. It requires only careful examination by persons of experience and good judgment in making purchases, to be followed by good management, to make investments certain to return largely for the outlay. For this there are thousands of opportunities, which we sincerely believe to be the best of any country, now offering to capitalists in the mines of Reese River.

From the *Nye County News* we clip the following: The Knickerbocker mill is now constantly running on ore from the Great Eastern claim, which the Knickerbocker company own. A lot of sixteen tons was crushed last week which gave a fine bar valued at \$827, being over \$50 per ton. This lot was taken just as it came from the ledge. Another lot of several tons gave a pulp assay of \$87. Dr. J. G. Riddle left upon our table some fine specimens of ore from the Hagerstown ledge, in Last Chance Cañon, Twin River District. The ledge is six feet wide, with nearly two feet of fine galena ore, and is considered a valuable claim. We still continue to hear good reports from Hot Creek District. The Pioneer mill was bid in by George W. Veatch, for the benefit of creditors, for \$8,845.12. In Twin River everything is stirring and brisk, a large force being at work upon the Murphy company's mill and mine, and much work being done upon

other mines. In Philadelphia District there are near two hundred men, all busily engaged upon the ledges. A large force is at work upon Buel's mill, which will be ready for operations in about two weeks. In San Antonio District the prospects of the miners are most encouraging. Messrs. Courter and Rigby expect soon to have a large force at work. Joe Sabon, who left here some three weeks ago on a prospecting trip in the eastern part of the county, has discovered three immense ledges, which he reports as a perfect mountain of silver. An assay of ore from the Great Eastern gave \$810 to the ton. Belmont is to be the great place in Philadelphia District. All look forward with impatience to the result of ore crushing by Buel's mill, soon to be started. If the yield is good there will be a rush to this place. We have been shown a letter, received by Mr. Davis from George Ayers, in which he says they discovered a fine gold bearing ledge, about sixty miles below Silver Peak, but owing to the Indians becoming troublesome, were obliged to abandon it, though they were at the ledge four days, and think they have a good prospect. The Mount Vernon company, in Mammoth District, are pushing work on their claims, and Mr. Howard informs us that a short time before he left, a fine ledge, showing splendid ore, was struck in the large shaft. The Knickerbocker mill is a splendid affair. It runs so quietly that conversation can be carried on in any part of the building with ease.

Humboldt.

The Register of July 28th has these items: The workmen on the Gem are taking out quartz for the Pioneer mill. Were working, a few days ago, in a vein of richest chloride—from which we expect to learn of a big return. Work was commenced on the North Star—by shaft following the ledge. We saw samples of the ore having threads of pure silver.

Esmeralda.

The Union of August 4th speaks of a new quartz discovery which created a great excitement in Aurora. The stampede commenced the very night the news was received. The most extravagant rumors were afloat. The locality is about three miles east of the summit of the high range of mountains between the Sweet Water Creek and the East Walker. The editor made the trip of fifty or sixty miles to satisfy himself of the truth in regard to the matter, and thus states it:—

We think it quite safe to say it is not less than seven and a half feet thick. It is astonishingly rich, and does not seem to contain a pound of waste rock, but shows the pure gold in every part from one side to the other. In some places it is so decomposed that it can be shoveled like gravel, and in these places the gold is very abundant, and can be collected by washing in a pan as in placer mining, each handful of dirt and gravel yielding almost a small spoonful of pure gold. Most persons who have seen the rock say it will pay \$1,000 per ton, and very few estimate it as low as \$500. It is unquestionably one of the richest mines ever discovered in the State, and the only doubtful question affecting its value now is its extent and permanency.

Pahrump.

The Reese River Reveille of August 2d, says: This district seems to be emerging from the clouds which have long obscured it. Work is being vigorously prosecuted by a number of companies. About one hundred and fifty men are constantly employed. A consolidation of several companies has projected a tunnel to pierce Silver Hill, upon which the best ledges yet discovered in the district are located. It is estimated that the tunnel will cut a number of veins, including the Illinois, in a distance of three hundred feet. The Illinois is a splendid ledge of fourteen feet in thickness. Before our informant left the district, information had been received that two 10-stamp mills were on the Colorado river detained by high water. They are designed for the Globe and International companies. A 5-stamp mill is also being brought from Los Angeles.

A private letter from New York, says: The Dahlgren company of New York, have commenced putting up furnaces and opening their mines, and Mr. Raymond, who represents another New York company, is on the road here with machinery.

Black Rock.

We copy the following from the Sage Brush, showing still richer workings of the Black Rock ore: "Messrs. Whiting, Nicoles and others have just returned from Washoe. They give a most flattering account of the recent working of Black Rock ore at Dall's mill. The Black Wax, worked up to the astonishingly high figure of \$700 to the ton; another lot of 500 pounds of Snow Storm ore, yielded at the rate of \$171 to the ton.—Marysville Express, Aug. 4th.

Owens River.

Kearsarge district is beginning to make a good show of silver bullion. The first run of Paul's mill produced between three and four hundred pounds. Some of the lodes in the vicinity are selling at \$100 per foot cash.

COLORADO.

The Denver News of July 25th, has these items:—Mr. J. W. Smith, the President of the Bohemian Mining and Smelting Company, has shown us a letter from Mr. Henry Cruw, superintendent of the company's works at Georgetown, dated the 15th, in which he says: "The furnace and smelting of the ores has proven a perfect success. The second charge, or run, we obtained thirty-three per cent., or one pound of metal from each three pounds of ore." We have seen the certificate of a second assay of a piece of the metal of the first run from this furnace, which shows a yield of \$3,362.29 per ton of 2,000 pounds. The mine now worked is called the H. W. Beecher lode, has a crevice of five feet in width, with a streak of eighteen inches solid galena, which yields 40 per cent. of metal. This metal, by assay at the U. S. Mint, gives a return of \$2,978.09 per ton of 2,000 pounds, in silver. No trace of gold. The capital stock of the company is \$50,000. The entire cost of the works, now nearly in running order, is \$8,000.

We have reliable intelligence from the Bear River country, dated July 15th. Our correspondent says: "There has been some prospecting done here. Parties who have come prepared to work have got their sluices about nearly ready to run, but they have none of them struck pay that will justify working. There are some six or eight gold-bearing gulches discovered and claimed, that prospect well on the surface, but on going down the dirt fails to yield a color.

The Register says:—J. T. Lynch is just in from Snake River. The mines are in a very encouraging stage of progress, much valuable ore being corded up at the several shafts. There are now at the Montezuma and Peru about ninety people at work. Mr. Lynch is sinking on the Suky lode. He has it opened for fifty feet along the surface, and has heavy compact galena throughout. The crevice is one of remarkable width. He has his furnace commenced, but it will not be completed before the 1st of August. The furnace recently erected by A. M. Cassidy is at work. Reicheneker informs us that he has made seventy-six assays, from as many different lodes, in the Snake River district. Two of these assays gave no silver. One gave three thousand five hundred dollars per ton. One, one thousand three hundred and seventy-nine dollars, and another eight hundred and one dollars per ton. The average yield was one hundred and twenty-five dollars per ton.

IDAHO.

The Owyhee Avalanche of 21st July, has these items; The Ainsworth mill has been thoroughly overhauled and new machinery added. It was to commence running in a week. The N. Y. & O. Co. are enlarging the settling capacity of their mill. There will be eight more settlers added, and the building enlarged to make ample room. For a time to come, the mill will run on Poorman rock; also the Grenzaback. We hear that it is rented to Moore & Fugus, for the summer. The Morse & Vass mill is engaged in crushing Whisky Gulch ore. This ledge contains some remarkably rich rock. A force of men have for some time been sinking on it, and they believe it will prove to be valuable. The Dardanelles mine is being worked from near the center of the ledge, by a shaft which is now forty feet deep, and is being sunk deeper every day. The ore looks richer as it is found deeper. That now taken out is being crushed at the Cosmos mill. They will test one hundred and twenty tons, and if the yield is satisfactory, a nearer and better road will be constructed via Long Gulch. The Varney & Carrico ledge, situated on Florida Mountain, was discovered July 10th. Nine ounces of the float quartz gave two dollars in gold by hand process. Rock from the ledge does even better than that. The shaft is now down ten feet, and a ledge of thirty inches quartz developed. We understand that the noted case of Hays & Ray vs. Poorman—properly, Wm. M. Willis vs. P. F. Bradford et al.—has been arranged between the principal parties so the mine will be temporarily worked and proved up. It has been a very exciting one among all classes and conditions of our citizens, in consequence of its fabulous richness. Messrs. Bell & McCann have taken gold dust enough out of their claims in Jacobs' Gulch this summer to make the eyes of an old forty-niner bug out. We saw, on Wednesday, a partial clean up of one week's run, and there must have been \$2,000. As much remained in the quicksilver, as we only saw the bright gold from the upper sluices. There is considerable coarse gold in it—many pieces weighing from two to twenty-five dollars.

Same paper of 28th, says: At no period in the history of Owyhee, has there been so much real labor done on ledges, as at this time. The Cosmos company must have fully one hundred men engaged in mining; the New York and Owyhee, half as many—probably more; the New York and Astor nearly fifty; the Lincoln forty to fifty; the Surplus Oro

Fino, as many; and Moore & Fugus about one hundred and fifty. The War Eagle company have let a contract and men are sinking a shaft on their purchase—the Revenue.

There are thirty or more men engaged in taking out Poorman ore. We got an inside view on Wednesday. We call the attention of the owners to St. Luke XVIII Chapter, 24 and 25 verses. We know several persons who talk as though they would be willing to risk their chances of salvation for fifty feet in this mine. We get did two feet in it—but were obliged to get them out again. Those who think the Poorman is "pocket" may as well dismiss their fears. The Richman is on the north side of War Eagle. A tunnel is being driven in the discovery and a shaft on the first extension north. A ledge of decomposed and solid quartz intermingled with granite can now be seen. At the further end of the cut the granite is giving way and more solid quartz is showing itself. The decomposed quartz is full of free gold which is easily obtained by panning. The New York and Astor company are now giving the Trook and Jennings ledge a thorough and systematic course of prospecting. The old shaft is being cleaned out, straightened, timbered and sunk deeper; also, a new shaft is being sunk about seventy-five feet north of the old one. The latter is already down fifty feet and the ledge is one foot wide. The same company are prospecting the Morning Star, 2d South extension. The ledge is narrow, but widening.

The World of 14th July, has these items: The water in all the ditches about Idaho City is rapidly drying up. Alturas (county) prospects have brightened much of late. The newly discovered ledge—the Leonora—is attracting general attention. We were shown, last Saturday, by one of the owners, several pounds of the rock from this ledge. The specimens can be described as sheets of gold with a little quartz holding them together. They were taken out at the depth of twenty-eight feet. The portion of the ledge at this surface was not wider than the back of a butcher's knife; it is now about two inches. The owners estimate the value of rock thrown out in a few hours, one day last week, at fully ten thousand dollars. The ledge is in the Yuba district, and is near the Atlanta. It has caused a great excitement among the quartz men of the district, and extensions have been located all over the country.

The Union of same date, says: S. G. Rosenbaum, of this city, has purchased the 10-stamp quartz mill lately placed on the eastern extension of the Gambirinus ledge, by Lambing and Baily. He is now the sole owner of the mill, and intends to keep the stamps at work steadily triturating ores from the Gambirinus and Junieta leads, as he owns three-fourths of each of those leads.

MONTANA.

From the Post of July 21st we gather the following:—In Alder Gulch, Mamma & Co., last week, employed fourteen hands, and the product of their labor amounted to \$2,870. Childs & Co., with three hands, took out \$600. Myers & Co., last week, with four hands took out from \$500 to \$600. Bay & Co., with seven hands, cleaned up \$900. Other parties on claims in the vicinity of those above named, state the result of their labor at about the same relative amount for the force employed. In Nevada District probably one hundred and fifty men were at work last week, the pay averaging from five to eight dollars per day to the hand. The building is ready for the Excelsior's machinery, which will arrive next week.

Letter to same paper from Prickly Pear City, July 6th, says:—

"The water has been very high, rendering the sinking of shafts in the gulches a matter of impossibility. One company backed down, but the other, Mr. William Alexander's, are still at work, and are much encouraged from the prospects obtained.

Good prospects have been obtained on the bars, on which the city is built, and a company of enterprising Germans have taken up the ground and have commenced the building of a large flume across the creek, through which the water from the ditch on the east side will be brought on to the bars.

Bannock letter says: Times begin to improve. Every low day some are returning from other camps to their old camping ground.

The Seneca Falls mill of 15 stamps run forty-seven days at an average of \$263 per day. The mill was unsupplied with any other than the old process of saving gold on the plates. The quartz was taken from the Kearsarge, Cavarone and Keokuk lodes.

WASHINGTON.

The Vancouver Register says:—Every test of rock from any of the ledges thus far has disclosed the presence of gold and silver, and that too in paying quantities. Work is progressing on several of the ledges. An arastra is running on the McConnel ledge, the Rising Sun and Morning Star Company is pushing forward its work, the Columbia ledge is being

sunk upon, and Mr. S. D. Maxon is manifesting commendable enterprise in opening another ledge which is thought to be rich. We have repeatedly said we would not be accessory to raising an unfounded excitement, and shall only state facts as they are made known. We believe in the Vancouver mines.

SAN FRANCISCO.—Perhaps no better idea of it can be obtained of the rapid growth and present importance of San Francisco, than by considering the fact that it is the fourth Collection district in the United States, and that an increase of only fifteen per cent. would be required to make it the second.

Trades and Manufactures.

WM. BARTLING, HENRY KIMBALL,
BARTLING & KIMBALL,
BOOKBINDERS,
Paper Rulers and Blank Book Manufacturers.
505 Clay street, (southwest cor. Sansome),
15v12-3m SAN FRANCISCO.

JOHN DANIEL,
(SUCCESSOR TO O. GOKI)
MARBLE WORKS,
No. 408 Pine st. bet. Montgomery and Kearny, San Francisco
Monials, Monuments, Tombs, Plumbers' Slabs,
Etc., On hand and Manufactured to order.
Goods shipped to all parts of the State. Orders respectfully solicited. 5v8-3m

Francisco. 4v13-1m

PACIFIC POTTERY!

STONEWARE AND EARTHENWARE OF ALL DESCRIP-
tions, such as: Butter Pots, Pickle Jars, Urns, Water
Jugs, Beut Pots, Flower Pots, etc., etc., from the manufac-
tory of N. CLARK, Esq., Sacramento—constantly on hand
and for sale, in quantities to suit, by
J. M. PAOE.

20v12-3m No. 42 Clay street, between Drumm and East.

FIRE, HYDRAULIC & SUCTION HOSE,

And Leather Belting.]

M. M. COOK & SON,

861 Battery Street, San Francisco.

Are now manufacturing as above, Fire, Hydraulic and
Suction Hose, and Leather Belting, of any dimension and
in any quantity which may be desired. Fire Hose and
Belting constantly on hand or manufactured to order. Also
Saddles and Horse Collars.
The subscribers would respectfully ask purchasers to call
and examine their stock—also testimonials of the efficiency
of their work from such as have used their hose both for fire
and mining purposes. A diploma was awarded to us last
year, by the Mechanics' Institute, of this city, and a silver
medal this year. 12v11-1y

J. F. & H. H. SCHAFER,

MANUFACTURERS OF AND DEALERS IN

Bedding and Furniture,

OF EVERY DESCRIPTION,

Blankets, Comforters, Sheets, Etc.,

504 and 506 Sansome street, near Clay,
San Francisco.

This establishment is now generally known to be the
CHEAPEST PLACE in the city for good bedding. 21v12-3m

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING and SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Mr. A. C. Knox, is our fully authorized Traveling Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.
SAN FRANCISCO, Jan 11th, 1866.

Mr. I. N. Hudson, is authorized to solicit subscriptions, advertising, etc., for the MINING and SCIENTIFIC PRESS, in San Francisco, and to receipt for the same.

It is impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

San Francisco:

Saturday Morning, Aug. 11, 1866.

UNPOPULARITY OF THE NEVADA STATE MINING LAW.

The mining law passed by the last Legislature of the State of Nevada, appears to be received with general disfavor throughout that State. We have already alluded to the fact of its being practically repudiated by the miners of Union district, assembled at Ione City. The Reese River *Reveille* says that the law is practically ignored in that district. The Humboldt *Register* reports the proceedings of a meeting of the miners of Star district, at which, after setting forth at considerable length the objections to the law, the following resolution was adopted:

Resolved, That as a matter of policy among ourselves, we will respect each others' claims, in this district, without the payment of such tax for assessment dues: *Provided,* That the erecting of monuments, filing of descriptive notice, and doing of assessment work, where such work is required, shall have been complied with in accordance with said State Mining Law.

The objections urged against the law are the onerous taxes imposed for the purpose of establishing a mining school, which the miners think will never be organized, and the supposed unconstitutionality of the law from the fact that it is partial in its operations. Storey, the most important mining county in the State, being excepted from its operations. Then, the regulations for securing title to the mines are so numerous, complex and diverse, as to be almost unintelligible to those concerned.

MAGIC PHOTOGRAPHS.—Professor Chichi, of St. Ignatius College, on Market street, in this city, called upon us a few days since and exhibited quite a number of magic photographs, which he had produced from the formula for their preparation which we gave in our issue of July 7th. The process of bringing out these photographs, and the surprise manifested at the unexpected and often ludicrous pictures, sometimes unexpectedly produced, form a source of much amusement to a parlor full of company.

A GOOD ARTICLE is worthy of commendation, however humble may be its service, so long as it is useful; for this reason we have ever been willing to speak a good word for Hook's & LAMBERT's axle grease, an article of California manufacture, which has stood the test of five or six years trial in this State. So far as we have heard, it has proven superior to any other thing of the kind ever offered to the public. We are pleased to observe that the worthy patentees are prospering in their business, as every one should do who makes an earnest effort to lubricate the world along.

WHEN Brazil was first discovered gold was in such common use that the inhabitants made fish hooks of that metal, no iron being used, although the country abounded with it.

NITRO-GLYCERINE TRIUMPHANT.

The public interest in nitro glycerine is still kept fresh, at the East, by discussions with regard to the possibility of its being rendered safe for transportation, etc. Notwithstanding the deplorable losses of life and property which have recently been experienced in various parts of the world, through accidents from this terribly destructive agent, there is every reason to believe that nitro-glycerine will yet be extensively employed for blasting purposes. As an evidence of this, we may state that a series of public experiments have recently been made at Washington, in the presence of President Johnson and a large concourse of Members of Congress and scientific men, the result of which has been that a bill has passed Congress providing for the transportation of nitro-glycerine, under proper precautions, and a company has already been organized for carrying on the manufacture of this article on a large scale. The experiments at Washington are said to have abundantly proved, that with proper care, there was no more danger in employing this agent, than ordinary blasting powder.

No one would favor the continued use of nitro-glycerine, if it must necessarily be attended with such terrible sacrifices as have heretofore been made; but the experiments above alluded to, and those described in our issue of June 9th, which were made in New York, go far to show that dangers from its employment are preventable. Since the experiments of Mr. Nobel, showing its almost perfect safety, when used with wood alcohol, numerous other scientific gentlemen have announced as the result of their experiments, several plans by which the same object can be more or less approximately obtained. Among others, Prof. Wurtz, the American discoverer of the new use of sodium amalgam, proposes to make a thorough mechanical mixture or emulsion of the nitro-glycerine with a saline solution of the same specific gravity. A solution of nitrate of zinc, lime, or magnesia, will probably be found to be suitable. When the nitro-glycerine is needed for use, water is added to the mixture, when the oil subsides and may be drawn off. Further experience seems to be needed to determine how long the mixture may be maintained without spontaneous separation.

Prof. Chas. A. Seeley proposes to prepare the nitro-glycerine more carefully, in order that it shall be perfectly freed from acid; and to prevent any future accumulation of acid, he proposes to keep suspended in the oil a small quantity of a substance in powder which shall neutralize any acid which may be generated, and which of itself shall have no action on the oil. This method is offered as an efficient prevention of spontaneous decomposition. The amount of neutralizing powder required is very little—sixty grains to the pound of oil might be sufficient. The quantity is so small that it would not interfere with the use of the oil, and need never be removed from it.

In actual practice one or more of these plans may be combined. The last is compatible with all the others, and should be used with all the others; nitro-glycerine should not be kept in storage, unless it is free from the danger of its most formidable property—the liability to spontaneous change.

It can scarcely be a matter of doubt with any intelligent mind, that the time will soon arrive, when the manufacture, transportation and use of nitro-glycerine will be carried on with as much safety as is obtained with gunpowder. Science will never permit such a useful and powerful agent, especially as an adjunct to mining operations, to lie idle for the lack of some practical method to render it safe as well as useful.

A NEW arrangement has been placed on the cars of the Portland and Kennebec Railroad for indicating the name of the station at which the train is about to stop. It consists of a glass case, conspicuously posted, containing a roll of white linen, on which is printed in bold type the names of all the stations on the road. As soon as one station is passed the brakeman turns the roll with a key until the name of the next station appears.

BEACH MINING IN HUMBOLDT COUNTY

Mr. Charles Brown, who worked at Gold Beach, in 1854, and has followed beach mining mostly since that time, has recently furnished us the following information regarding this rare class of mining. He is now in copartnership with Thomas Risbon, owning claims of five hundred yards fronting on the Pacific Ocean, near high tide mark, the pay sand extending back about one hundred feet. The location is two and one-half miles south of Crescent City, Del Norte County, California. Two other miners are working similar claims, adjoining Brown & Co., on the north. Another company of three men commenced mining about one mile south, a month ago, but have not got fairly at work, or for some other reason have not made their operations pay.

The method of operating by Brown & Co., is partly that of the old "long tom" system. The "tom" into which the sand is dumped from a wheel-barrow, is six feet long and four feet wide. Two feet of the lower portion is made of sheet iron, perforated with holes about one-eighth of an inch in diameter, and one-half inch apart. Under this iron is set the amalgamating copper-plates, in a box four by eight feet, at an angle of about fifteen degrees. The perforated iron overhangs the upper portion of the plates, and allows the gold and sand to sift through, while the coarser particles of gravel, which might interfere with the coating of the plates, remains to be shoveled off. About midway of the plates, a box three inches wide and four inches deep, is inserted across the bottom. To the depth of an inch or so in this box is placed a strip of board, about six inches wide, which answers as a breaker or distributor, causing the sand and water to pass under it into the box and out on the lower side evenly over the plates. Another similar box sets at the extreme lower end of the plates, to catch the particles of quicksilver or amalgam that may become detached from the plates. The plates are amalgamated with quicksilver, and when in proper order the surface is as bright as a mirror. These plates are taken off and warmed to a proper heat in order to clean them up, which is done not oftener than once a month. Much care has to be taken in cleaning the plates not to injure the surface, and the coating will then last for years. Fresh quicksilver is frequently applied to moisten the plates, which is accomplished by shaking it through a cloth evenly over the surface. A small addition of sodium amalgam to the quicksilver, before shaking it upon the plates, would greatly facilitate and improve the process of covering them with quicksilver.

The supply of water, which is limited, is obtained from a spring, and has to be brought from a reservoir by a flume half a mile in length. Mr. Brown judges from experience that salt water would answer as well as fresh water, if it could be as cheaply obtained. By this method, two men are enabled to wheel up and work some twenty tons per day, averaging about eight dollars per day to the hand. Mr. Brown informs us that he made as high as seventy-five dollars per day in washing at Gold Beach, near the mouth of Rogue River, in 1854, without using copper plates at all. He thinks that other rich spots will yet be discovered on the border coast of California. It is our opinion that improved facilities for working these auriferous sands will yet prevail, and beach mining become an important branch.

PATENTS BOUGHT AND SOLD.—Mr. J. H. Atkinson, who informs us that he has had much experience in the sale of patent rights and patented articles, has established himself in that business at the corner of Kearny and California streets, in this city. A reliable agency of this kind will be of service.

MINERAL COLLECTION FOR SALE.—We would call attention to the advertisement in this issue of the sale of specimens of Nevada minerals. Such collections are not to be purchased at all times.

CARPENTER'S IMPROVED ROASTING FURNACE.

Mr. Carpenter has sent us two photographic representations of sectional drawings of his furnace. This furnace consists of an ordinary reverberatory hearth, in which a draft of air is admitted, at intervals, from openings in a longitudinal channel running across the furnace, and directly in the rear of the fire bridge, admitting fresh air, charged with oxygen, between the heated air and flames of the furnace, and the ore which lies upon the furnace hearth. In the center of each opening in this longitudinal channel is placed a small steam jet, all communicating with a steam pipe inclosed in the brick work at the base of the fire bridge, by which a continuous current of steam is made to pass, with the fresh air, between the flame of said furnace and the ores upon its hearth. The chief peculiarity of this furnace, as we understand it, consists in this combined air and steam jet, as above described.

In extracting gold and silver from their sulphurets, it is well known that it is the presence of the sulphur which causes the great difficulty attending the operation. One equivalent, or one half the sulphur, is very readily driven off at an ordinary heat; but to remove the other equivalent requires so great a heat that there is danger of vaporizing, and thereby losing a portion of the precious metal, or melting and so combining it with the sulphur and iron and other metals present, as to render its after separation a matter of exceeding great difficulty. This is especially the case where the ore contains copper, either native or in any of its combinations. In such cases there is formed in the furnace either auriferous rose copper or black sulphide of copper, in which the gold will be mechanically held, and from which it cannot be readily separated by any subsequent process.

The efforts of Mr. Carpenter, as we understand his process, has been to remove the difficulties of the last part of the roasting, and to drive off the last equivalent of sulphur with a less degree of heat than is ordinarily used; thereby cheapening the cost, by reducing the amount of fuel and time required, and saving the loss of precious metals from the excess of heat usually employed.

These ends, we suppose, he claims to attain by introducing the current of fresh air between the flame and ore, giving the hearth a greater oxidizing power than can be obtained from the de-oxygenized air which has passed through the furnace; while the steam admitted with the fresh air rapidly takes up and passes off the sulphur as sulphureted hydrogen gas. In theory, at least, it would appear that this furnace should possess a material advantage over those of ordinary construction.

We furnish the above for the consideration of those engaged in roasting ores, and should be pleased to hear further from the inventor, especially if he has made any practical application of his principle. His address and specifications may be found under the head of "New Patents," and the photographic representations may be seen at this office.

LARGE CALIFORNIA MADE BOILERS.—Messrs. Moynihan & Aitken, of the Portland Boiler Works, have just completed the largest set of steamship boilers ever manufactured on this coast. They were made for the opposition steamship America, and are at present to be seen at Hathaway's wharf, where, owing to their immense size, it was necessary to set them up outside of the shop. These boilers are thoroughly constructed and double riveted throughout. Their combined weight amounts to about eighty tons, or 160,000 pounds. Such boiler work is complimentary to California manufacturers.

NEW QUARTZ MILL FOR BROWN'S VALLEY.—By the Marysville *Daily Appeal*, we learn that the Pennsylvania Mining Company have contracted with the Marysville Foundry for an 80-horse engine, boilers, hoisting gear, an 8-inch pump, pipes, etc. The price is not made public, but all will not cost much less than \$15,000. The work is to be completed and delivered in sixty days, and it is expected to be in running order by the 1st of November.

A MISTAKE.—The MINING AND SCIENTIFIC PRESS asserts that there are only *forty-seven* square miles of anthracite coal beds in the United States.—*Reese River Reveille*.

Wn worn in error in the above by just one figure, which figure, however, makes a very material difference. Instead of "47" wn should have said "447" square miles. With the exception of three or four basins or patches of very limited extent and value in other States, Pennsylvania is the great depository of anthracite, so far as discovered on this continent. This entire anthracite area is made up of numerous segregated basins, produced by alterations of anticlinal and synclinal axis, all of which range nearly parallel with the base of the Alleghany Mountains, but on their eastern slope, while the bituminous coals are found on the western slope. Their nearest approach is at the northeastern extremity of the bituminous coal field, where that and Wyoming anthracite basin is separated by only a narrow crest of the Alleghany about ten miles across.

Great Britain possesses a far larger area of anthracite than exists in America, or in fact any other part of the world; but owing to the fallacious notion that such coal cannot be pleasantly used in dwelling houses, on account of its emitting more noxious vapors than other varieties, and for another equally unsubstantial reason that more difficulty is encountered in kindling and burning, it has never been so generally introduced there as here. As has already been hinted, in the article which called forth the above correction from the *Reveille*, Great Britain might learn a useful lesson by a careful inquiry into the American modes of using this coal, and the decided advantages it possesses for almost all purposes, over any other fuel.

THE NON-RECOIL GUN, alluded to in our last issue, is to have a thorough practical trial. The London *Engineer* says: "Mr. Harding, the inventor, has brought it under the notice of the French and Belgian Governments, who have each appointed a commission to examine and report upon its merits. Mr. Harding is drawing, at the Hydraulic Tube Company's Works, a gun of 4-inch bore with 2-inch thickness of steel around the chamber, and we hope soon to be able to give the practical results of a conclusive trial of the most extraordinary system of ordnance known to modern times." The result of experiments on this new principle in the resistance of gases to be made on a scale that promises useful and practical effects, will be awaited with a very great degree of interest.

ALKALI—WHAT IS IT?—This term is one of such constant use that it is well to fully understand both its derivation and its precise meaning. The word is of Arabic origin. *Kali* is the Arabic word for bitter, and *al* is equivalent to our word *super*. We say fine and superfine; and as *kali* is bitter, alkali is very bitter or superlatively bitter. In short, alkali is the very dregs of bitterness. The New England *Farmer* describes alkali as follows:

Alkali is a general term which includes all those substances which have an action like the ley of wood-ashes. If this is boiled down it forms potash. What is chiefly understood by the term alkali means potash, soda, and ammonia. Potash is the alkali of land plants; soda is the alkali of sea plants; and ammonia is the alkali of animal substances.

Potash and soda are fixed; that is not easily raised in vapor by fire. Ammonia always exists as vapor unless fixed by something else.

Lime, fresh slacked, has the alkaline qualities of potash, but weaker—so has calcined magnesite, but in a less degree than lime. Here are two substances, earthy in their look, having alkaline properties. They are called, therefore, alkaline earths. When the tongue is touched with a bit of quick lime, it has a hot, burning, bitter taste. These are called alkaline properties. Besides these, they have the power of combining with and taking the sour out of all sour liquids and acids; that is, the acid and the alkali neutralize each other. Were it not for this, there would probably be no such thing as vegetable growth.

WM. H. GABB.—We learn from a paragraph in the *Woodland News*, that Mr. Wm. H. Gabb, of the State Geological Survey, is now engaged in his especial work of exploration in Lake and Mendocino counties.

NEW PATENTS.

Recently issued from the United States Patent Office, and of special interest to residents on this coast.

MANUFACTURE OF ARTIFICIAL STONE.—William Kirrigan, London, England, claims: 1st, The manufacture of artificial stone, bricks, and tiles, or other hard material, by mixing and using the sulphate of iron or other similar metallic sulphates, or other similar mixtures of acids with metallic bases, and several other materials described, in combination with cement and silica, and limes and silica, contained in the materials described. 2d, The application of coloring matters in combination with the silica and other materials. 3d, In the manufacture of bricks and tiles from plastic materials, the application of the materials specified for the purpose of effecting a more perfect combustion, burning, and hardening, thus producing a superior form of article.

ROOF OF BUILDINGS.—William W. Boach, New York City, claims: 1st, The use of mica or mineral glass in sheets or plates as a roofing material, transparent, translucent, opaque, and nonmetallic for roofing purposes. 2d, Ornamenting upon or between the plates or thicknesses of the mica, as described. 3d, Making an elastic roofing by cementing the plates of mica with flexible cement. 4th, The combination of mica with wood, slate or other equivalent substances.

TREATING ORES.—Charles F. Carpenter, Louisville, Ky., claims a mode of using steam of any temperature for the purpose of facilitating the process of extracting gold and silver from ores, which consists in introducing said steam into a reverberatory furnace between this flame of said furnace and the ores containing gold or silver, which are spread upon the hearth of said furnace, as herein described, or any other substantially the same.

A full notice of this invention will be found elsewhere in our editorial columns.

BURNING FLUID.—David Mansfield, Oshkosh, Wis., claims a burning fluid for illuminating purposes, which is composed of the several ingredients mixed together in about the proportion herein mentioned.

COMPOSITION OF MATTER.—Lewis Francis, assignor to himself and Cyrus H. Loutrel, New York City, claims combining glue, glycerine and silicates, with or without saccharine matter, to form a new and useful composition of matter for various purposes.

BUTTON-HOLE SEWING MACHINE.—James A. and Henry A. House, Bridgeport, Conn., claim: 1st, Working a button-hole automatically and on both sides without turning the cloth by the devices, substantially as described. 2d, The scroll cam ratchet-wheel to give a rectilinear reciprocating motion to and govern the length of the button-hole. 3d, The combination of the scroll cam ratchet-wheel, shifting pawl, and jog-bar. 4th, The combination of the scroll cam ratchet-wheel, the sweep bent-lever, and jog-bar, to space the stitching. 5th, The combination of the reciprocating vibrating clamping plate, the adjustable switch-wedge, and the jog-bar, for the purpose of varying the length of stitching for a button-hole. 6th, The combination of the jog-bar, clamping-plate, moveable switch, and switch-block, to sew both sides of button-holes automatically. 7th, The combination of an adjustable stitching-plate with the fixed bed-plate. 8th, The combination of the clamp to hold the cloth with an adjustable screw-pivot to render the bearing surface of the clamp parallel with cloth of varying thickness. 9th, The combination of the vibrating and reciprocating plate with the adjustable clamp, when so arranged that both shall move together to hold the cloth smoothly between them.

PATENTS can be obtained for citizens on this Coast through the MINING AND SCIENTIFIC PRESS PATENT AGENCY, in one-half the time it takes to operate through Eastern agents. From our familiarity with the subject of most California inventions, and the benefit arising from personal explanations, we are prepared to present claims with greater accuracy than could reasonably be expected of distant agents.

DEWEY & CO.,
Patent Agents, 505 Clay Street, San Francisco.

TO CORRESPONDENTS.—Another number of the series of articles by Professor Rowlandson, on "The Chief Gold Districts throughout the World," has been received, and will appear next week; also a letter from our Traveling Correspondent, "Prospector," written from Nevada county. We shall make further allusion to the New Mining Law next week, when we shall endeavor to answer the queries of our correspondent "B. Honest."

AUCTION HOUSE.—Messrs. Olney & Co. have opened a General Auction and Commission House, No. 418 Montgomery street—a very central and convenient location. Mining and other Corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Besides every kind of auction business, this firm will pay special attention to the purchase and sale of real estate in Oakland.

THE SAN FRANCISCO PHOTOGRAPHIC ARTISTS' ASSOCIATION.—This Association, which has been organized for the very laudable object of improving the interesting and popular Art of Photography, held its first election for officers on Monday evening, August 6th. The following officers were elected: President, Silas Selleck; Vice President, Alex. Edoaarts; Treasurer, W. H. Rolofson; Secretary, H. C. Bennett; Trustees, Wm. Shew, C. F. Hamilton, Jacob Shew, D. H. Woods, H. Oleson, D. Wright, J. C. Chalmers, W. Dickman and G. H. Johnson. Dr. I. Rowell, Dr. W. O. Ayers, Dr. Blutchley and H. C. Bennett, as a mark of appreciation for their services in the cause of science, were elected honorary members of the association.

Wn heartily wish the association a full measure of success. Photography having become the most popular art of the age, whatever tends to its improvement, also tends to elevate the public taste for the true and beautiful in nature and art.

AN OLD BEAM.—Among the demolitions required by the works a new Hotel-Dieu, Paris, was one of a very old house, in pulling down which, the workmen found an immense oak beam in good preservation, about three feet square, with the following inscription, rudely carved, but distinctly legible on one of its faces: "I was placed here in the year 1450, and I was 600 years old when taken from the forest of Rovray." The venerable piece of wood thus found, dates from the reign of Charles the Bald, 25th king of France, who reigned from 845 to 861.

Every man has in his own life follies enough; in his own mind, troubles enough; in his own fortunes, evil enough, without being curious about the affairs of others.

Answers to Queries.

J. G. L., of Iowa Hill.—Package received and contents examined. No necessity for an assay to determine that there is no platinum present. The sample sent is composed chiefly of pyrites, the entire mass containing about three dollars to the ton in gold.

W. B., Visalia.—You are entirely mistaken in the character of the mineral sent. It presents no indication, whatever, of tin. An assay would be merely money thrown away. The specimen is an asbestiform tremolite, composed of silica and magnesia in about the proportion of 70 parts of the former to 30 of the latter, with a trace of lime. The mineral has no commercial value.

HYDRAULIC HOSE MANUFACTORY.

THREE SEAMS SEWED WITH TWENTY-PLY TWINE, and guaranteed to stand the pressure of 100 to 200 feet fall. One to three-plies hose made. All orders punctually attended to.

S. HOWARD,
aull-ly 326 Davis street, San Francisco.

MINING AND SCIENTIFIC PRESS

PATENT AGENCY.

For the Pacific Coast.

Office of the MINING AND SCIENTIFIC PRESS—No. 505 Clay street, corner of Sansome, San Francisco.

Information for Inventors!

Inventors on this coast having their applications for patents made out through our Agency can sign their papers at once, and thus secure their rights at least three months sooner than by sending the papers to distant agents, situated in New York or Washington.

The first question that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is to submit his plans to persons experienced in the business of procuring patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely conclude his plan to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to receive them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and a description of the invention should be sent together with stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Caveats.

A caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the inventor to receive notice, for a period of one year, of any application for a patent subsequent to the filing of the caveat, and is likely to interfere with the invention described in the caveat, and the inventor is then required to complete his application for a patent within three months from the date of such notice, and the caveat is then very carefully prepared. Our fee for the service varies from \$10 to \$20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftentimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian, Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from \$20 to \$50. If the patent is granted no further agency expenses ensue. If the application is rejected we cause thorough investigation to be made into the reasons presented to the Government for refusing the patent. In making this examination, our Washington agent has access to all the drawings, models, books and specifications filed in reference, and we report the results as far as possible to our clients.

If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution work we charge a fee proportionate to the extent of the contest, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement. The system adopted by all works of skill, gives equal satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects, will be glad to be further advised by our expert and successful of our unequal facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously. When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: Dewey & Co., Mining and Scientific Press, No. 505 Clay Street, corner of Sansome, San Francisco, Cal. Proper expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is not paid until the case will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication; the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance.

The following is the Government tariff of fees established by law:

On every application for a design, for 3 yrs and 6 mos.	\$10
On every application for a design, for seven years.	\$15
On every application for a design, for fourteen years.	\$20
On every application for a patent, for seven years.	\$15
On every caveat.	10
On issuing each original patent.	20
On filing a disclaimer.	30
On every application for a re-issue.	30
On every additional patent granted on a re-issue.	30
On every application for an extension.	50
On the grant of every extension.	50
On appeal to the Commissioner from Examiners-in-Chief.	25
On every appeal to the Judges of Circuit Court, D. C.	25

We have had successful experience in conducting these appeals, and our services are rendered on moderate terms.

N. B.—We make out our own forms for applications, caveats, and reissues, and respectfully inform all parties that we have no printed blank forms for sale.

DEWEY & CO., Agents.

Mining and Scientific Press Office, No. 505 Clay street, corner of Sansome, San Francisco.

A PECULIAR FISH.—Sir Charles Bell says: "We have a curious instance of the precision of the eye and of the adaptation of muscular action, in the beaked chaetodon, a fish which inhabits the Indian rivers, and lives on the smaller aquatic flies. When it observes one alighted upon a twig, or flying over (for it can shoot them on the wing), it darts a drop of water with so steady an aim as to bring the fly down into the water, when it falls an easy prey. It will hit a fly at the distance of from three to six feet. Another fish of the same order, the zeus, has the power of forming its mouth into a tube, and squirting at flies, so as to encumber their wings, and bring them to the surface of the water. In these instances, a difficulty will readily occur to the reader. How does the fish judge of position, since the rays of light are refracted at the surface of the water? Does instinct enable it to do this, or is it by experience?"

As Sir Charles Bell was one of the closest observers, and most trustworthy writers of his time, the above, curious as it appears, must be received as unquestionable authority.

TIMBER MEASUREMENT.—The dimensions of round timber are found by girthing the log, and taking one quarter of the girth for the side of the square. Hence the rule: Multiply the square of one-quarter of the circumference by the length of the timber, and you have the contents of the log or tree.

The gayest smiles are often the saddest weepers.

J. B. COX, BUSINESS AGENCY.—Makes private sales of Property and Business Places of every description, in the city and throughout the State; procures partners with large and small amounts of money; negotiates sales of mining property, and does a General Agency Business. Patronage solicited by mail, express, or by personal application at the office, 402 Montgomery Street, San Francisco, California. 23v111r

Machinists and Foundries.

PALMER, KNOX & CO.,
Golden State Iron Works,
Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF
MACHINERY,
STEAM ENGINES AND QUARTZ MILLS
DUNBAR'S IMPROVED
Self-Adjusting Piston Packing,
Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER & RANDALL'S
NEW GRINDER AND AMALGAMATOR
HEPBURN & PETERSON'S
AMALGAMATOR AND SEPARATOR,
Tyler's Improved Water Wheel,
Giving the greatest power, at lower cost, than any wheel in use. There are over 1,500 running, giving universal satisfaction.

KNOX'S AMALGAMATORS,
WITH PALMER'S PATENT STEAM CHEST,
Superior for working either Gold or Silver Ores.
Genuine White Iron Stamp Shoes and Dies
Having been engaged for the past eight years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, in the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-17

M. GREENBERG. W. H. MOORE.
GREENBERG & MOORE,
Eagle Brass Foundry,
No. 43 First street, San Francisco,
(Between Mission and Market.)

MANUFACTURERS OF all kinds of Brass and Bell Castings; Force and Lift Pumps; Cocks and Valves of every description made and repaired; Oil Globes, Steam Whistles, Hydraulic Pipe and Nozzles (for Mining purposes). Also, COUPLINGS OF ALL SIZES.

Particular attention paid to Hydraulic Pipes and Nozzles; also, to Ship Work of all descriptions. All orders from the interior will be attended to with promptness and dispatch. 23v123m

LEWIS COFFEY. J. S. ANDERSON.
LEWIS COFFEY & RISON,
Steam Boiler & Sheet Iron Works.

The only exclusively Boiler Making establishment in the Pacific Coast owned and conducted by Practical Boiler Makers. All orders for New Work and the repairing of Old Work, executed as ordered, and warranted as to quality. Old Stand, corner of Bush and Market streets, opposite Oriental Hotel, San Francisco.

J. F. FLYNN. HENRY FRANGE.
FLYNN & FRANGE,
EMPIRE FOUNDRY,
221 Mission street, below Beale, San Francisco, PRACTICAL IRON FOUNDERS, having unequalled facilities for the manufacture of Lion's Paw Castings, particular attention will be given to this department. We manufacture School Seats and Desks, Agricultural Implements, Railing, Ship Castings, Stake Irons, and all other kinds of Heavy and Light Castings, with dispatch. The patronage of the public is respectfully solicited. 21v124y

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, Screw and Drop Presses, Coining Machinery, File Drivers, Bark and Malt Mills, and all kinds of Castings.
ENGINES.—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.
BOILERS.—Locomotive, Fire, Tubular, Upright, Cylinder and Corliss, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.
PUMPS.—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's Improved Tractory Curve Pan, Zenas Wheeler's Improved Flat bottom pan, Uchlin's pan, Veach's tubs, Prater's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastra Gearing, Chille Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or Iron Frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Canis, Pans and Tubs. BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

OIL BORING TOOLS AND MACHINERY.—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.
Russia Iron Screens, of all degrees of fineness and of all qualities of Iron. All work done in the best manner at the lowest cash prices.
H. J. BOOTH. 650, W. PRESCOTT. IRVING M. SCOTT.

H. J. BOOTH & CO.

Vulcan Iron Works Company

[ESTABLISHED 1850.]

First, Natoma and Fremont Streets.

IRON FOUNDERS,
Steam Engine and Locomotive BUILDERS,
Boiler Makers, and Workers in Sheet Iron, Brass and Copper.

These Works have lately been increased by the addition of new shops on Fremont Street, doubling the capacity of the original establishment. Their facilities for turning out machinery promptly and efficiently, are now unequalled in the State. Their Boiler Works have also been enlarged correspondingly.

The Company are prepared to execute orders for all classes of Machinery and Boiler Work, such as

Mining, Steamship, and Steamboat Machinery,
Railroad Machinery, Floating Mills, Locomotives, Quartz Mills, Car Trunks, Sugar Mills, Car Wheels, Saw Mills, Hoisings and Irons; and
Manufacturing Machinery of Every Kind.

Sole Manufacturers of
HEPBURN & PETERSON'S REDUCING PAN AND AMALGAMATOR
BEATH'S AMALGAMATOR;
HESSE & MOORE'S IMPROVED HOWELL QUARTZ CRUSHER;
BAUX & CUIOD'S AMALGAMATOR AND SEPARATOR;
FAUCHER'S QUARTZ GRINDER AND WATER WHEEL;
JONVAL'S IMPROVED WATER WHEEL;
LEFFEL'S AMERICAN DOUBLE TURBINE WATER WHEELS;
STEVEN'S PISTON PACKING RINGS.

They have also a large assortment of Patterns for Pumping and Hoisting Machinery, Gearing, Pulleys, Water Mill Irons, Hydraulic and Screw Presses, Retorts, Furnaces, Grate Bars, House Fronts, Ornamental Fence Posts and Paving Stone Ranges, etc., etc.

Quartz Stampers, Shoes and Dies, of the best Hard Iron. Quartz Screens of Russia Iron Punched to Order. 27

Miners' Foundry

—AND—
MACHINE WORKS,
First St., between Howard and Folsom Streets,
SAN FRANCISCO.

EVERY description of Iron and Brass Machinery, the BEST and MOST ECONOMICAL, manufactured in the State of California, will be furnished with dispatch at the MINERS' FOUNDRY AND MACHINE WORKS, such as
Steam Engines and Boilers, Flour, Saw and Quartz Mills, Machinery, Mining Pumps, Amalgamators, Retorts, Etc., Etc.

Particular attention will be given to the manufacture of Machinery in Sections designed for pieces of difficult access. Various models of Quartz Crushers, Amalgamators and Water Wheels—some in operation and on exhibition.
Parties desiring to test their ores practically, in small quantities, will be afforded simple facilities, free or cost.
All parties desiring accurate and highly finished drawings and superior Machinery, at most reasonable rates, are cordially invited to call before contracting elsewhere.

HOWLAND, ANCEL & KING
GEORGE T. PRACY,

PORTABLE ENGINES, OF ALL SIZES,
DONKEY PUMPS, Etc., Etc., Etc.

The attention of the parties engaged in shipping or inland navigation is called to the

Superior Workmanship

of Mr. LOCHHEAD, who has been in the business in San Francisco for the last fourteen years, and enjoys the reputation of having built ONE HUNDRED AND SEVENTEEN STEAM ENGINES.
Screw Propellers of all kinds, and Steam Boat Machinery generally, made to order, and warranted to give perfect satisfaction in every particular. 23v123m

WATER VEINS—CURIOSITIES OF MEADOW LAKE.—The Sun says there is something rather strange in connection with veins of water that pass through the valley on which the town of Meadow Lake is built:

A. Grant, whose premises are situated near the base of the hill on the north side of town, at the depth of four feet from the surface of the ground, struck one of these veins, which in a few moments filled the well and flowed over the top of it. C. M. Lake, who sunk a well near the Lake House, at a depth of fifteen feet, also struck a vein, which when opened boiled up like a boiling pot, filling the well almost half full. J. D. Cross, at the present time, is sinking one about half way between the two mentioned, and on an exact line. The well is now down twenty feet, and the dirt taken from it contains but little dampness, in fact, is almost as dry as though it had been baked in an oven. The earth taken from this well is entirely different from anything we have ever seen in the district, being a kind of yellow talc or clay, which always breaks with a smooth glossy surface. In other places large granite boulders are found imbedded in smoothly washed gravel. We have no doubt but the greater portion of the valley at some former period was the bed of a lake. Where the large bodies of washed gravel came from we are unable to say, from the fact that the surrounding hills show no gravel whatever. There being lakes situated in the vicinity of the town at a greater elevation than the valley may be the cause of the water coming up with so much force when a vein is opened.

Mr. WEAVER, an optician, of Oxford street, London, has invented a clever instrument which will prove of great value to all who wear spectacles. All good spectacles are now made of pebbles, which do not scratch like glass, and are more free from flaws, but all pebbles are not good ones. This instrument, though without understanding it, makes the quality of the pebble at once apparent to the eye. If the lens placed in it is glass, the spectator cannot see through it at all; if a good pebble, he can see through an even piece of topaz; if bad, his eye is distracted by all the colors of the prism. The multitude of angles in a bad lens worry and strain the eye, as anybody can see who will look patiently for a minute through an ordinary window-pane, usually the very worst piece of glass to make.

WASHING HANDS.—If the water has lime in it, use very little with soap, because the soap has to dissolve the lime before it will act well upon the matter it is intended to remove; merely dipping the fingers in the water to take up just enough to make a solution of soap sufficient to take up the dirt is, with hard water, the only way to keep the soap from sticking to the hands. When the dirt is removed, rinse the hands in plenty of water, or in two portions of water if there is not plenty. The barbarous old practice which we still often see, of washing with soap in one portion of water, is a proof that those who practice it have not thought about it; the soap is worse than most of the dirt it is used to remove, and ought to be thoroughly washed from the hands, clothes, or whatever it is used upon. Brown soap is unfit for the toilet, and the economy of it is small—too small for even the poorest to think of, in comparison with the offensiveness of it.

WINE PRODUCT OF CALIFORNIA.—The extent of the California wine interest is comparatively little known to the Atlantic States. Every year increases the product immensely. The estimate for the present year is 350,000 gallons in Los Angeles county, 350,000 gallons in Sonoma county, and 300,000 in the remainder of the State, or 1,000,000 gallons in all—more than four times the entire product of the United States in 1860.

A STRANGE PLACE TO PLAY CARDS.—The diving bell has been abandoned on the Thames river, in England, in favor of the diving dress, principally because the men employed were found, while the Westminster Bridge was being built, to spend their time at the bottom playing cards, and there was, of course, no effectual means of keeping a check on them. It is not easy to play cards in a diving dress, and the remedy has proved very satisfactory in its operation.

PROGRESS.—Some writer has defined "Progress" as follows: "Truths are first clouds, then rain, then harvest and food." The philosophy of our century is the common sense of the next. We should so live and labor in our time that what came to us as seed may go to the next generation as blossom, and that which came to us as blossom may go to them as fruit. This is what we mean by progress."

CHEMICAL.—An exchange accounts for the rapid disintegration of the Austrian Empire during the present European war, by a consideration of the great dissolving power of Prussic acid.

THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequalled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call special attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greens Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully solicited.

GODDARD & COMPANY.

International Hotel,
JACKSON STREET,

READ IT! READ IT!!

SACRAMENTO, April 16th, 1866.
H. BOWMAN—DEAR SIR: THIS IS THE FIRST WRITING I have done in two years, and it affords me great pleasure to be able to use my pen in the service of those who are suffering, as I have suffered, by stating the following facts:
I have for two years and upwards been afflicted with CHRONIC RHEUMATISM, and until a few weeks ago I have never found anything that afforded me any relief. For three months of the time I was unable to feed myself, and for the last five months my arms have been so bent that I have not been able to dress myself. I was five months at the Warm Springs, at San Luis Obispo, and three months at a Hydropathic Institute in Stockton, and I have been under the care of six different physicians, in the vain hope of relief. About four weeks ago I was induced by a person who had been cured by it to try a bottle of RICHARD'S REMEDY FOR RHEUMATISM, and in less than twelve hours I experienced great relief. In a few days I was enabled to straighten out my arms, and I have been getting better and gaining in strength and flesh ever since. I have now the complete use of all my limbs, and, for the first time in two years, I am out of pain. I do feel for those who suffer as I have suffered, and if they will take my advice, they will lose no time in giving the REMEDY a trial. Yours truly,
GEORGE TAYLOR.

RICHARD'S REMEDY is for sale by
H. BOWMAN,
Druggist, Sacramento.
Price, \$2.50 per Bottle.
21v12

Important to Californians.—Many inventors have lately had their claims for Patents seriously and in some cases fatally delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safe course is to trust their business with none but active and experienced solicitors. The MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

ASSAY AND BULLION BALANCES,
And from France and Germany, as well as the Eastern States FURNACES, CRUCIBLES, MUFFLES, BLOW-PIPE CASES, GOLD SCALES, CHEMICAL GLASSWARE, and every article required for ASSAY OFFICES, LABORATORIES, etc. We have given this branch of our business particular attention, to select such articles as are necessary in the development of the mineral wealth of this coast. A Full Assortment of DRUGGISTS' GLASSWARE and DRUGGISTS' SUPPLIES, ACIDS and CHEMICALS, constantly on hand.
San Francisco March 6, 1865 11v10-1f

NAPA CITY, May 9th—Messrs. Dwyer & Co., Patent Agents, San Francisco: Yours of May 7th is at hand. I am pleased to hear of the receipt of our caveat papers at the U. S. Patent Office, Washington, D. C. You have my fullest thanks for your energetic movements concerning the same. Respectfully, yours,
W. W. LEVERING.

Capitalists, Attention!

**QUARTZ MILL & MINING PROPERTY
FOR SALE
In Nevada County.**

A NEW 8-STAMP QUARTZ MILL, 7 LEDGES AND 440 acres heavily timbered land, near Eureka, Nevada County, are now offered for sale. The Mill is run by steam-power, and is in complete order for business. The ledges, which form the principal value of this property, are all large and well defined, but require a further outlay of capital, in order to make them remunerative. For the lack of means to properly develop these claims, the present owners are disposed to sell the same for a reasonable price. Capitalists wishing to engage in mining will find this a splendid opportunity to purchase a property that will bear right scrutiny, and offers superior inducements as an investment.

For address and further information, inquire of the Publishers of the MINING AND SCIENTIFIC PRESS, 505 Clay street, San Francisco. 22v12

HAYWARD, COLEMAN & CO.,
IMPORTERS AND REFINERS
—OF—
**Illuminating, Lubricating,

SPIRITS OF TURPENTINE & ALCOHOL

NOTE.—We would specially call the attention of Mill owners, and Engineers, to our superior PARAFFINE OIL, which we manufacture from the California Petroleum. This Oil will not gum. Machinery thoroughly cleaned and lubricated with it will not heat, and after remaining at rest, can be started without cleaning off.

A sample can of our Paraffine Oil will be forwarded on application to us, as we desire a fair and impartial trial.

Lamps and Lamp Stock!
An elegant and complete assortment on hand. 4v13-3m19 414 Front street, San Francisco.

**THE CALIFORNIA
Aerated or Unfermented
BREAD COMPANY.**
Bakery on Folsom Street,
Between Tenth and Eleventh.....SAN FRANCISCO

MESSRS. TAGGART, BULKLEY & DUFF, HAVING ASSOCIATED themselves in partnership, are happy in announcing to the public that they are now prepared, and would respectfully solicit all orders for their truly whole and cleanly Bread. We have a sufficient number of delivery wagons at our bakery to guarantee to all who may favor us with their patronage a prompt delivery of fresh bread daily, Sundays excepted.

Through the kindness of the gentlemen of the following named firms, we are privileged to keep an order box for the entry of all orders for the bakery so that they may reach our earliest attention.
Order box at C. J. Hawley & Co.'s Grocery, corner Second and Jessie streets; Rowland & Walker, 617 Clay street; Plims's Carpet Store, Montgomery street, opposite Lick House; O. W. Clark, Paper Hanging, corner Sansome and Clay streets. Orders handed to any of the route-men likewise. We expect soon to be prepared to supply Pastry, likewise the Boston Brown Bread, and Deans of the first quality. Due notice will be given.

The present Company is entirely independent of the former California Unfermented Bread Company, neither of them having been in any way connected with that company. We would cordially invite the public to make a visit to our new bakery.

J21

R. W. EGENER, Secretary.

San Francisco, August 1, 1886. a4

Economy in Advertising.—The Mining and Scientific Press is the best and most economical mining advertising medium in this city. Our terms are less than one-half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper paper for the concentration of mining patronage.

The Press is a large, sixteen-page paper, and is truly a valuable assistant to the mining interests of the Pacific Coast.—[Bye County News.]

George Washington Gold and Silver Mining Company, Silver Mountain District, Alpine County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the third day of August, 1886, an assessment of ten cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, 311 Market street, San Francisco, or to G. W. Russell, Crescent City.

Any stock upon which said assessment shall remain unpaid on the fourth day of September, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-fourth day of September, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

C. REYWOOD, Secretary.

Office, 311 Market street, San Francisco, Cal. a4

Lady Bryan Gold and Silver Mining Company, Location of Works: Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twelfth day of July, 1886, an assessment of one dollar per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at the office of the Company, 523 Montgomery street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-fifth day of August, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on the eleventh day of September, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

H. O. HOWARD, Secretary.

Office, 523 Montgomery street, San Francisco, Cal. J21

North America Tin Mining Company, Location of Works: Durango, Mexico.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 21st day of May, 1886, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Bell, G. W. Estate of	87, 105, 107	140	\$54 00
Beyea, J. L.	89, 90, 98	86	34 00
Brown, E. P.	155	25	10 00
Christensen, C.	95	8	3 20
Dwuelle, J. W.	8	100	40 00
Fox, J. W.	69	100	40 00

White, Robert N.	115	10	4 00
Miller, J. E.	101	50	20 00

And in accordance with law, and an order of the Board of Trustees, made on the 21st day of May, 1886, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Olney & Co., at No. 418 Montgomery street, San Francisco, on the 20th day of August, 1886, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

I. N. THORNE, Secretary.

Office, Room No. 7, at 535 Clay street, San Francisco, Cal. a4

Nuestra Senora de Guadalupe Silver Mining Company, Tayollita District, Durango, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 25th day of June, 1886, an assessment of one dollar (\$1) per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, E. J. Pfeiffer, at the office, No. 210 Post street, or to the Treasurer, A. H. Himmelman, at his office, No. 327 Washington street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the 31st day of July, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the 18th day of August, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

E. J. PFEIFFER, Secretary.

Office, 210 Post street, San Francisco, Cal. J20

Postponement.—The day for deeming stock delinquent on the above assessment is hereby postponed until Monday, the 27th day of August, 1886, and the sale thereof until Monday, the 17th day of September, 1886. By order of the Board of Trustees.

E. J. PFEIFFER, Secretary.

J28

THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; a, Dies; c, Shoes, and o, Openings.

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan when properly constructed, are respectively 177, 118 and 132.

That is, the respective millers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan one hundred and eighteen tons, and the Conical Pan one hundred and thirty-two tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes direct from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been brimished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,
WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the
PACIFIC FOUNDRY,
171 San Francisco.

LEFFEL'S American Double Turbine

THIS WHEEL, WHICH HAS HAD THE most unprecedented sale of any water-wheel ever made, and which has given unusual satisfaction whenever used, is now for sale by KNAPP & GRANT, 310 Washington street, San Francisco, where persons desiring to use water-power can be supplied. These Wheels are adapted to use from 10 to 5,000 inches of water, and from 4 feet to 500 feet fall. Let us know how much water you have either in mill-race or cubic feet per minute, what fall you have, and what power you require. Write or send for circular to
KNAPP & GRANT,
—ALSO—
San Francisco.

Leffel's Lever Jacks,

For railroads, cars, or wagons; Railroad Jacks for engines and cars; Track Jacks for leveling, with which three men, with a pair of these Jacks, can level more track in a day than twelve men working in the ordinary manner; also, Track Jacks, for relieving the axle of pressure to replace the brass. These Jacks are now in general use in the Eastern States, and give entire satisfaction. Also, Wagon and Track Jacks of the most superior make and kind. For sale by
KNAPP & GRANT,

BAUX & GUIOD'S Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine Scientific Knowledge with Practical Experience, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgamators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The tripling cost for attendances; Its small cost; Its portability. The large quantity of pulp it can operate upon in a given time. It may be worked even weeks without stopping, as it is constructed to work continuously. The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them. They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jefferson Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crall's Gravel Cement Works, Nevada county; Walman's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Yachoo.

Manufactured at the Vulcan Iron Works and San Francisco Foundry, San Francisco, and at Heugh & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address
J. B. BAUX,
Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v5-6m

It tells us truly the Minute, Hour, Day of the Week and Day of the Month.

HORTON'S PATENT CALENDAR CLOCK!

MANUFACTURED BY THE

ITHACA CALENDAR CLOCK COMPANY,

Ithaca, N. Y., and for sale by

W. J. EGBERT, Agent,

At JOB M. SEAMAN & CO'S, 631 WASHINGTON STREET, San Francisco.

THIS TIME PIECE costs but a trifle more than any other good clock, and is just the article for every well-regulated business house, office, saloon, or, in fact, any place where a handsome, perfect time-keeper is duly appreciated. The Clock has two dials, the first being the same as an ordinary clock; the second has but one pointer, and shows the day of the week, the month and day of the month. It is arranged to mark the days in leap years with equal regularity. It is an eight-day piece, and runs from year to year without change. It can be examined at the Office of the MINING and SCIENTIFIC PRESS. 2v13p16-tf

To Ditchmen, Millmen and Others Requiring IRON PIPE.

M. R. ROSE, CORNER OF 9TH and K STREETS, M. Sacramento City, has facilities unsurpassed on this coast for the manufacture of IRON PIPE of every description. He also has on hand a deep well FORCE PUMP, of his own invention and manufacture, well adapted for oil wells. His tools being portable, pipe can be manufactured on the ground. 19v12

EXCELSIOR PUMP!

HOOKE'S PATENT!

CHALLENGES COMPETITION!

THIS DOUBLE-ACTING SUCTION AND FORCE PUMP CHALLENGES COMPETITION for simplicity, durability and power, and will work at any depth. The pistons for Mining Pumps are packed with hemp. The valves are reached by simply removing the "bonnets" thereby avoiding the trouble of raising a long column of pipe. They will raise as much water as TWICE their size of single-acting Mining Pumps, and are sold at half the price. We have never heard of the valves in this Pump being out of order. For their many superior points they are fast replacing all other Force Pumps. Reference can be given where this Pump is working with eighteen others of different patterns, and is pronounced THE BEST; also, from some of the best miners in the State who have them in use. For manufacturers, farms or domestic use, we warrant them the best and cheapest. All sizes adapted to any power or any purpose. For sale by agents throughout the State.

J. W. BRITTAN & CO.,

General Agents, 120 Front street, San Francisco. 2v13m

STODDARD'S CELEBRATED WATER FILTERS!

RENDER RAIN, RIVER, OR SPRING VALLEY WATER perfectly pure and healthy. Three sizes. Price, \$12, \$16 and \$18. For sale by

S. B. STODDARD, Corner of Battery and Pacific streets 25v12-3m

Union Amalgamator.

This Valuable Invention

IS FAST FINDING ITS WAY INTO GENERAL USE, NOT by means of combination of capital and influence, but on the strength of its own merits, and upon the principle that what is known to be good will be appreciated. Practical men acknowledge the UNION PAN to be scientific, the best, the cheapest, and most profitable. It now stands first on the list of all pans in use for the purpose of

Working Gold and Silver Ores.

It has been found that a low class of ores, also tallings from Mills, Sulphurets, etc., that will not pay to work with the common pans, may be worked with this and obtain large profits. The UNION PAN is manufactured in two sizes, and capable of operating upon large quantities of ore in the most efficient manner.

Parties interested in Quartz Mining, Mills, etc., will find it to their advantage to call and examine for themselves, and see its operation.

Gold and silver ores tested by regular mill process, at moderate cost, by

STRONG & CO.,

San Francisco Foundry, corner Mission and Fremont streets, where orders will receive prompt attention. 15v12-3m

BRUCKNER'S Mechanical Roasting Furnace

AWARDED A

PREMIUM SILVER MEDAL

—BY THE—

The Mechanics' Institute.

THESE FURNACES ARE NOW MANUFACTURED AFTER an improved mode of construction, which GREATLY SIMPLIFIES THEIR OPERATION,

and afford a much larger oxidizing surface to the action of heat and atmosphere.

The weight of a Furnace nine feet long by four feet in diameter does not exceed one ton.

THE IMPROVED FURNACE

May be seen in operation, for desulphurizing or roasting and chloridizing, at Central Mill, Virginia City, Nevada.

Parties wishing to erect such Furnaces, are requested to leave their orders with

T. KALLENBERG,

19v12 416 Market street, San Francisco.

FLORENCE SEWING MACHINES!

COPY OF THE REPORT OF THE COMMITTEE OF AWARDS AT THE FAIR OF THE

AMERICAN INSTITUTE,

New York, 1865,

—TO THE—

Florence Sewing Machine Company,
FOR THE BEST FAMILY SEWING MACHINE.

HIGHEST PREMIUM—GOLD MEDAL!

REASONS:

- 1st.—Its simplicity and great range of work.
- 2d.—The Reversible Feed Motion.
- 3d.—The perfect finish and substantial manner in which the machine is made.
- 4th.—The rapidity of its working and the quality of the work done.
- 5th.—The Self-adjusting Tension.

The "FLORENCE" was awarded the First and Highest Premium at the State Fair of California, the only Fair on the Pacific Coast at which any two double-thread Sewing Machines were exhibited in competition in 1865.

The "FLORENCE" received the only premium awarded by the Mechanics' Institute of San Francisco, in 1864 and 1865, to any Sewing Machine, Sewing Machine Company, or Agent. The claim of a competitor to a medal is without any foundation whatever.

Wherever the "FLORENCE" has been brought in competition with other Sewing Machines, it has always been declared the best. It is the most simple, the most substantial, the most efficient, and its use is easily learned. Every Machine sold is guaranteed in the full sense of the word.

Send for Circulars and Samples of Work.

Pacific Forge Company.

FORGING AND IRON WORK.

THE PACIFIC FORGE COMPANY HAVE JUST ERECTED, in this city, on Fourteenth street, near the machine shop of the San Jose Railroad, a large establishment for the purpose of forging and working in wrought iron. Our hammer is the largest upon this coast, and we are prepared to manufacture, at short notice, all kinds of heavy forgings, car axles, shafts, steamboat cranks, piston-rod, wagon axles, and other similar work. This is the first general shop of the kind erected in this State, and we solicit the patronage of the public. All orders executed at reasonable rates, and with promptness and satisfaction. 19v12-3m

NEW QUARTZ PULVERIZER.—The Grass Valley Union says that Mr. P. Fox, an experienced engineer and machinist, is endeavoring to introduce into the quartz mills of that place a pulverizer, for which he has obtained a patent. He states from what he has seen of quartz tailings there, that his pulverizer is a *sine qua non* in every mill, as it receives the crushed quartz from the battery, and then reduces it to an impalpable powder by means of rotary grinding stones. At the Ophir they have cylindrical grinders, which are very good, but he claims that his grinders, being of stone, reduce the quartz to a finer state, and is also a much quicker process. One pulverizer is sufficient for five stamps. The expense is very moderate, and the machine is readily applied. It is the arasta principle, but the action is quicker and the quartz reduced finer. There is a great difference in the cost.

THE DIFFERENCE.—The Stockton Independent, alluding to the comparative cost of mining operations in California and Nevada, says: One great advantage in engaging in working mines in this State, in preference to mines elsewhere, is the comparatively small cost of mining and reducing ores in California. Compare California with Nevada, for instance: It appears that it cost the Chollar Potosi Company last year, on an average, \$22.27 per ton to mine and work its ores. In California the cost of mining and reducing the ores ranges from \$4 to \$8 per ton—\$5.50 being about the average. Thus, in this State, gold ore which will yield \$10 per ton will yield a rousing profit, while silver ore in Nevada paying \$20 per ton cannot be worked except at a great loss. Those seeking for mining investments should bear these important facts in mind.

SPONGES.—It may surprise the reader to be informed that the quantity of sand he finds in a new sponge has not been inclosed there, by the animal or vegetable during its growth, but is an adulteration practised by the agents and merchants who purchase the sponge from the divers, in order to increase its weight and their profit. Sand of the fineness requisite for the purpose, is mixed with water, in which there is a little gelatine or gum to enable the sponges to take up and retain it the better, and without being detected afterwards; the sponges are then well kneaded into it, so as to fill up their minute pores and dried. In this way a hundred weight of sponges in their dry state, will be so sanded as to weigh more than a ton before they are packed for exportation to Europe.

WATER-PROOF ENAMEL FOR CARD PHOTOGRAPHS.—The following process for enameling cards is a very good substitute for the collodion transfer process, and is much easier of application. First apply to the surface of the card, with a brush, a solution of gum arabic in water, of sufficient strength to give considerable gloss when dry. As soon as dry apply a coating of plain collodion in the same manner as coating a plate. If the solution is not very tough, two or three coatings may be applied to advantage. Finish by passing the card through a roller and you will have a fine gloss. Care must be taken not to have the gum solution too thick, or the surface will crack when dry, though there is but little danger if the collodion is applied soon after the gum is dry. Gelatin, instead of gum arabic, answers the purpose well, though it gives hardly as much gloss. Perhaps you or your readers may have a better process than this. If so, let us have it.—*Philadelphia Photographer.*

VARNISH FOR PHOTOGRAPHS.—M. Bussi first brushes the prints over with a solution of gum arabic, and when this is dry, applies a coating of collodion. The following are the proportions recommended: 1. Clear transparent gum arabic, twenty-five grammes; distilled water, 100 cub. cents; dissolve and strain. 2. Gm cotton, three grammes; alcohol, sixty grammes; ether, fifty grammes. By this double varnish the inventor insures the preservation of the proofs.—*Chemical News.*

INCORRODIBLE BLACK INK.—A black ink, not corroding steel pens, and neutral, may be prepared by digesting in an open vessel forty-two ounces of coarsely powdered nutgall, fifteen ounces of gum senegal, eighteen ounces of sulphate of iron (free from copper), three drachms of aqua ammonia, twenty-four ounces of alcohol, and eighteen quarts of distilled or rain water. Continue the digestion until the fluid has assumed a deep black color.

The vapor of mercury escapes from that liquid at all temperatures above forty degrees. Many persons have lost their lives by inattention to this fact.

Eyes! Eyes!! Eyes!!!

DR. HENLY, Oculist and Aurist, has received from Scotland one of the most miraculous remedies for the benefit of the human eye ever before discovered. It is unparalleled in its effects upon the disease incident to this organ. It gives wonderful power to the optic nerve, and removes all the granulations from the lids, and all mucous film from the sclerotic coat without the use of instruments. In fact, it works like a charm on the eye, without giving any pain. You feel the effect of the medicine in different parts of the head. It drives the disease back into the system, which is better able to stand it than this tender organ.

Why will you suffer when you can be cured in a few days. Persons who have been blind for ten years have been restored to their sight in a short time by the use of this medicine. I will treat any person's eyes in the State, and I'll not give them relief in a short time, I will not charge them anything. Office, No. 751 CLAY STREET, opposite the Plaza, San Francisco. 22 v12

ANNUAL REPORT —OF THE— Pacific Insurance Company.

IN COMPLIANCE WITH THE ACT OF THE LEGISLATURE of the State of California, entitled "An Act concerning corporations," passed April 22, 1884, the Pacific Insurance Company of San Francisco makes the following Annual Report:

I.—The amount of the Capital Stock of this Company is SEVEN HUNDRED AND FIFTY THOUSAND DOLLARS, and paid in GOLD—\$750,000.
II.—The amount of the Assets is ONE MILLION AND FIFTY-ONE THOUSAND, FOUR HUNDRED AND TWENTY DOLLARS AND THIRTY-SEVEN CENTS, \$1,051,243.57.
III.—The Company has NO DEBTS.
IV.—The amount of insurance effected during the year, and which remained in force December 31, 1885: Marine, \$12,973,949; 454,408
This Company commenced underwriting Marine Risks, August 1, 1885.
V.—This Company insures against the following risks, viz.: BUILDINGS, HOUSEHOLD FURNITURE, MERCHANDISE, RENTS, LEASEHOLDS, VESSELS IN PORT AND THEIR CARGOES, and other PERSONAL PROPERTY, AGAINST LOSS OR DAMAGE BY FIRE.
Also, on CARGOES, TREASURES, COMMISSIONS, PROFITS, and WAR RISKS, and ON ALL MARINE AND INLAND NAVIGATION RISKS, TO AND FROM ALL PORTS IN THE WORLD.
VI.—This Company will take on any FIRST-CLASS RISK not to exceed \$75,000 (the limit fixed by law), and on all large risks will reinsure to an extent consistent with PRUDENCE in other RESPONSIBLE COMPANIES.
J. HUNT, President.
A. J. RALSTON, Secretary.

THREE SIZES,

5, 7, and 10-Horse Power

HITTINGER'S.

TWO SIZES,

5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, and Economy, with the Minimum of weight and price.

These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes.

Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises), in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with and without carriages.

Also, Portable Saw and Grist Mills.

NEW PUBLICATIONS.

EPIDEMIC CHOLERA; Its Modes of Treatment; Their Respective Results; with Directions for Prevention; and what to do in Cases of Sudden Emergency. By John F. Geary, M. D., San Francisco; H. H. Bancroft & Co., 1866.

The above is a pamphlet of fifty-four pages, designed for popular information with regard to the medical treatment of cholera. The author belongs to the homœopathic, or "New School of Medicine," and the chief portion of the work is devoted to a popular review of the different modes of treatment adopted severally by the allopathic and homœopathic practitioners. The concluding pages are devoted to a consideration of the public sanitary measures necessary to be taken in view of the approach of epidemic cholera; the modes of prevention, and what to do in cases of sudden emergency. Of course the remarks under these several heads are made from a homœopathic stand-point, and will prove of especial interest to all such as prefer that mode of practice.

A TREATISE ON SHIP BUILDING: A Plain Statement of the Process of Delineating the Lines of a Vessel on a Floor.

The above is the title of a pamphlet of twenty-four pages, with several illustrations, designed to be placed before young ship-builders, as a plain statement of the process of ship drafting. The author, William Laister, who has been a practical ship-builder in this city, and on this coast since 1852, has prepared this work for the especial benefit of those who have not had an opportunity of consulting more elaborate works upon the subject, and which, he thinks, as a general thing, are calculated to perplex rather than instruct, or, at least, are of but little use to those who have not already attained a preliminary knowledge of the business. The aim of the present writer has been to write a book on ship-drafting which any shipwright can understand; and which, whatever may be its merits or demerits, will no doubt be appreciated at its true value by those for whom it has been prepared.

AN IMPROVED TURBINE.

The growing demand, at the East, for water as a motive power, is acting as a stimulus for inventors to contrive the most economic use of such water that can be obtained. For small quantities, especially when a high head can be obtained, no class of wheels can be more conveniently and economically used than those known as turbine wheels; and it is consequently in that class of wheels, chiefly, that most of the improvements in water motors are now being made. When we consider the great amount of money expended throughout our

perspective view of the turbine complete; the other, is a view of the wheel and shaft.

This turbine is now being generally used throughout the East, and especially in New York, New Jersey, and the New England States, where great economy of water is necessary, from the constantly decreasing supply, owing to the clearing up and better cultivation and drainage of the land.

The inventor of this turbine experimented with one of his "Improved Jonval Turbines," at "Fairmount Works," Philadelphia, in 1859 and 1860, under the direction of H. P. M.

fully matured and carefully embodied in the Helical Turbine, in its present improved form, and by adding improvements that were found only in practice to be such, have made it the most complete, powerful, and durable turbine ever made, equal in efficiency and superior in simplicity of construction to the improved Jonval Turbine.

The step is made of steel, running in oil, upon a composition metal of peculiar construction, placed in the hollow shaft above the wheel, and so arranged that it can be taken out and cleaned and put back in its place in ten minutes, which is required to be done only once in about two months.

The issues of the wheel are large, and not liable to clog up with rubbish, and it runs equally well in backwater as out. It utilizes all the head.

It is said to have been fully tested by the side of the best constructed over-shot wheels in

PERSPECTIVE VIEW OF THE JONVAL TURBINE.

mining and manufacturing States, in procuring a supply of water, and saving it up for use during the dry season, the necessity of economizing its use becomes at once apparent, and we begin to realize the great importance of the water power of the country.

In this consideration the great object to be gained in selecting a water wheel, is to obtain one built on scientific principles, deduced from long practical experience, and which can be depended upon at all seasons of the year to give the greatest maximum of power with the average minimum of water.

The inventor claims to have attained these ends in the Helical Jonval Turbine, represented by the accompanying engravings. One is a

Birkibine, Chief Engineer of the Water Department, and O. H. P. Parker, Chairman of the Water Committee, producing a result, according to the test, of 8777 per cent. of useful effect, exclusive of the friction of the transmitting machinery, which was calculated at three per cent., making a total of 9077 per cent., being from six to twelve per cent. over all turbines of the same class, and from fifteen to twenty per cent. over the best scroll and centre wheels; thus coming in competition with nineteen different wheels by some of the best builders in the country, and obtaining results never before equalled in any practical test.

The main principles and features of the turbine producing these results have been more

WHEEL AND SHAFT.

the same mill, arranged so that the same machinery could be driven alternately by the over-shot and turbine, showing large results in favor of the turbine, in amount of water used, and greatly increased production, owing to the regularity of speed and power.

For further information address J. E. Stevenson, Hydraulic Engineer, 40 Day street, New York.

TO CORRESPONDENTS.—We have received another letter from our Reece River correspondent, "Progress," which will appear next week. We are much obliged for the favor from a Sierra correspondent, "J. H. C." which will appear in our next.

DANGER FROM BITING FINGER NAILS.—Most disastrous results have recently been ascertained to have resulted from the practice which many children have of biting their finger nails. A late correspondent of the *Country Gentleman*, writes that something over a year ago there died in his neighborhood a bright little girl of seven years—and no one, not even the physicians, could tell what caused her death; but some time after a case came to their knowledge of a child's dying under similar circumstances, on which a post mortem examination was had, and it was found that she had bitten off her finger nails and swallowed them, and they were found sticking in her stomach, which was ulcerated wherever they stuck. In the case first alluded to, the parents had known of the child biting her nails, but thought nothing of it until the other case was told them. They now suppose that was the cause of her death, and for the sake of other parents and children are desirous to make the above facts as widely known as possible. How many of the "little innocents" have thus come to an untimely end, is known only to Him by whom the hairs of our head are all numbered.

FISH PROPAGATION.—THE CHINESE STILL AHEAD.—The Chinese, to whom it appears, of late, we must look for the initiation of most of what have usually been considered modern ideas, have, from time out of mind, been in the habit of collecting the impregnated eggs of fish, and of depositing them in the clear streams irrigating their rice fields. Nay, they have even anticipated our eel-culture in a most ingenious manner for the purposes of pisciculture. In order to facilitate the hatching of fish-eggs, they are in the habit of making a small aperture in a fowl's egg, sucking out its contents, and replacing it with fecundated fish ova. The egg is then placed under the hen for a few days, and the ova are thereby so far ripened that it is only requisite to break the egg into egg-warmed water, in order to speedily produce—not a chicken, but a brood of young fishes! In China, notwithstanding its enormous population, fish is so cheap that it forms a very important part of the food of the people, and nothing, we are told, more astonishes the Celestials than the high price of that kind of food in this country.

AN EATABLE CANDLE.—A good deal of amusement may be created by making and eating what is apparently the old stump of a tall candle. This is done by cutting a piece of apple in the shape required, and sticking into it a little fragment of nut or almond. You then have a candle stump. The almond wick can be lighted, and will burn for more than a minute, so that the deception is perfect. You can afterwards eat it in the presence of the company.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Notes on the Chief Gold Districts Throughout the World.

BY PROFESSOR ROWLANDSON, F. G. S. L.

[Continued from page 66.]

HUNGARY AND TRANSYLVANIA—PRELIMINARY EXPLANATION.

In my earliest published views on the "Age of Gold Bearing Rocks," which appeared in the *Altus* in the year 1863, a part of which was copied *verbatim* in the MINING AND SCIENTIFIC PRESS, an opinion was expressed that in Hungary a probability existed that the gold found in that ancient auriferous region was derived from veins existing in Silurian, or, at all events, in paleozoic strata. Before the completion of the series, however, not only had that opinion become much modified, but almost completely changed; but on grounds and information too imperfect for anything like implicit adoption. Subsequently, a work on Hungary and Transylvania, by John Paget, came into my possession, which, although not written with any attempt at strict technical definition, is evidently the work of a gentleman who was somewhat acquainted with general geology, was a keen observer, and better still, an accurate describer. A perusal of the two volumes alluded to, which contained many interspersed geological observations, too numerous and lengthy for quotation, yet very pertinent, and highly corroborative of the general view taken by me respecting the Age of Gold Bearing Rocks, has satisfied me that it is exceedingly improbable whether gold can be found in the countries now under consideration, excepting as placer gold, in rocks of other than secondary or even more recent age. Before, however, entering into details more strictly connected with scientific geology, I shall proceed to make some lengthy extracts relative to some matters which will probably prove interesting not only to the general but also to the technical reader, as they are very little known, commencing with a brief account of

A BIG MINING TUNNEL AND DITCH.

This important work, which extends from Schemnitz to the valley of the Gran, is about ten English miles in length. It is called Joseph the Second's Adit, and has been constructed with the object of conveying the water from, and otherwise facilitating the drainage of mines, which, without such auxiliary aid, would not be workable. It is twelve mining feet high, and ten broad, and so constructed as to be used either as a canal or railroad, so that the ore may be carried to some more convenient point for smelting than Schemnitz. Its total cost amounted to more than \$2,500,000, and upward of fifty years were occupied in its construction. Near this tunnel a thin vein of coal was found—quality inferior; dykes of greenstone porphyry abound in the vicinity, accompanied by masses of trachyte, in which latter are found the celebrated opals of this region.

At Kremnitz the gold and silver matrix is entirely quartz, the rock generally greenstone; here, however, as at Schemnitz, the *uppermost veins have ever proved the richest*. Thanks to a patriotic Archbishop of Gran, Kremnitz enjoys a plentiful supply of water. In former times the prince of Hungary enjoyed the titles of Master and Assayer of the Royal Mint. The Archbishop alluded to constructed a water-course, at his own expense, from the county of Thorotz to Kremnitz, a distance of fifty English miles. There are some other matters in the vicinity of Kremnitz deserving of a brief notice, amongst which may be mentioned an interesting one connected with the

CAVING OR SLIDING IN OF UNDERMINED METALLIFEROUS MOUNTAINS.

In the one about to be described, near Kremnitz, Hungary, the crown of the mountain, for about eight hundred feet long and six hundred feet wide, has fallen in, so as to occasion a valley of considerable depth. There is no record or tradition as to what period this

rupture occurred. To some extent, however, the aspect of the rocks and adjacent country tells the tale, as the perpendicular face of the rock is, pierced in every direction with the mouths of old mining shafts and levels to which no passage now exists, and, consequently, must have been formed prior to the catastrophe. The aspect of the whole justifies the conclusion that the cave-in took place in consequence of the greed which abstracted too great a proportion of the underlying ore. The whole of the exposed underlying surface consists of quartz, and is described as presenting an appearance not greatly dissimilar to that of a ruined Sicilian temple.

The other remarkable instance of "caving in" is the *Csetatie Mare*, "the great fortress" in Transylvania. The outer top of this mountain has fallen in, exposing a vast hall in the heart of the mountain, which is open to the heavens. This can be entered by a cave at the side, large enough for laden horses, through which the visitor soon arrives at an immense open circular space completely walled in by solid rock. The upper part is described as having an opening something similar to that of an immense volcano. Into this space a large number of openings of old levels exist of varied sizes and forms, the remains of former workings, and are highly illustrative of the history of mining in Transylvania. There are to be seen small passages scarcely large enough for the body of a man, which may probably be assigned to the labors of the Dacians, the progenitors of the modern Wallacks. Here, also, may be witnessed the stately chiseled levels of the Romans, by the side of evidences that fire had been in some cases the agent employed for disintegration and extraction, not far from which may also be seen traces of the modern Wallacks' labors. It is considered that the mountain must have been excavated to a mere shell prior to the "cave-in." Some of the old Roman levels, which penetrate deep into the mountains, have been constructed on such a scale of magnificence that it is asserted that there is room for a carriage and pair to drive along them.

Near Voros Patak, the name of the town which is most contiguous to the two Csetaties, is situated the Csetatie Mike, or little fortress so called, from its presenting the appearance of a ruined fortress, or what would be more appropriate, that of a honey-comb, as it is pierced through and through in every conceivable direction. These quotations ought to have the effect of lessening the enormously exaggerated notions which so generally pervade the minds of Californians, and the residents of the contiguous districts, as to the uniqueness of its mineral wealth, whether we view the subject either as to its geological position or immensity of development.

Virginia City and Gold Hill, so far as appearances have yet presented themselves, must sink their pretensions when compared with what has been effected, and probably still can be repeated, in Transylvania. A similar remark might be made so far as the extensive workings which existed in ancient times of the Ogov gold mine in Carmarthenshire, South Wales, the wreck and debris from which covers a valley containing a surface of forty square miles, the entire area being covered with broken quartz to the depth of several feet.

BOHEMIA.

As with the case of Hungary, my earlier impressions were that in this country gold was probably found in Silurian, or at least in paleozoic rocks. In, however, collecting materials for the concluding chapter of this series, I became reminded that the celebrated rich mine of Joachimsthal cuts through basalt containing olivine, which overlies tertiary lignite, in which have been found leaves of dicotyledonous trees; thus establishing its formation as late as at least as the tertiary era.

In closing a brief epitome of the gold districts of Europe, and especially the countries noticed in this paper, the reader's attention is called to the fact that, as in California, the auriferous portions thereof are intimately associated with the upheaval of mountain masses, such as the Alps, Apennines, Carpathians, Pyrennees, and their sub-branches, at some post-cretaceous period; and that the matrix of all the alluvial gold in the countries named will, most probably, on more careful examination, be found to exist on rocks from the Liassic or Jurassic, to those of tertiary age—the association of gold bearing rocks with secondary and tertiary carbonaceous deposits, and boracic acid, in several instances, has already been noticed. I am desirous, however, of again calling attention to the fact that cinnabar and native mercury have been found in Europe, as in California, amongst the same rocks and under circumstances not greatly dissimilar, a fact well worthy of deep consideration, as it must be the effect of some common and widely pervading influence.

Good manners are a part of good morals, and it is as much your duty as your interest to practice it.

[Written for the Mining and Scientific Press.]

From Nevada County.

BY OUR TRAVELING CORRESPONDENT.

[Continued from Page 386 Vol. XII.]

MESSRS. EDITORS: You heard from me last from Colfax. Want of time is my only apology for not writing sooner. Much that was attractive to the "prospector," as well as wonderful to the student of nature, was presented to view in the immense gravel deposits at Gold Run and Dutch Flat, in Placer county, and more especially in what is known as the "blue lead," which makes its appearance at Indiana Hill, below the former place, and is found underneath similar deposits at Little York, You Bet, Hunt's Hill, and other portions of Nevada county. No less interesting was the net-work of mineral veins—as remarkable in number as in the richness of their ores—which were to be seen upon every hillside, and in every cañon in the vicinity of Nevada and Grass Valley. But as these have been so frequently described in the local papers, and also in the columns of the PRESS, a further notice at this time is unnecessary.

The past week has been spent chiefly in visiting some of the quartz lodes, and a large area of gravel deposits, similar in depth, width, value, and perhaps in most respects to those referred to above, lying principally between the south and middle Yubas, and extending from Badger Hill, near North San Juan, as far east as Moore's Flat, a distance of about fifteen miles; embracing a section deservedly meriting public attention, not only from the amount of gold which it now yields, or has produced in past years, but also in view of the vast treasures still garnered here, but requiring a silver key in many instances to unlock the granite vaults in which they are too safely stored.

SPECULATIONS.

Resting for a day at Columbia Hill, early morning found me again at my old trade, in search for more quartz lodes, piloted by two intelligent gentlemen of the place, who, by the way, dragged me a little out of my sphere, and into water somewhat deeper than I had been accustomed to, as any one might judge from the sequel.

Question. How were these wsh gravel deposits formed? *Ans.* Evidently by the action of water.

Ques. By the washing of river or ocean channels? *Ans.* In some instances, wholly by former rivers; in some, wholly by the ocean, and in a large proportion of cases, by the action of both causes, operating at different periods.

Ques. Why may not all have been formed by channels of rivers? *Ans.* 1st, The effects are too great to have been produced by such a cause. 2d, The deposit in many instances is totally different in character from that made by our ordinary rivers, being finer, and made up principally of small quartz pebbles, sand, clay, and less of vegetable matter, indicating a greater amount of wear and tear than in the former, which contains large granite and slate boulders, and richer deposits of gold, but unequally distributed, similar in every respect to those now found in any of our mountain streams, while in the latter the gold is of a different quality, generally more evenly distributed and in less quantity, not being made profitable to work except by hydraulic power.

Ques. Why is it necessary to assume the hypothesis, that some of these deposits were placed here by the operation of both causes? *Ans.* Because these two deposits, so different in almost every particular, are often found together, and the one superimposed and always in the same order; as in the case of the "blue lead," which appears to be a river deposit, having a wholly different character of gravel overlying, and to all appearance organic in formation; the old river channel having been submerged, and the upper strata having been deposited by the same powerful action of the ocean's waves; the color and other marks of the former giving indications of a submergence.

Fortunately for me, the catechetical exercise was abruptly brought to a close by our arrival somewhat unexpectedly at our place of destination. We stood on a ridge 1,200 feet or

more above the ebanel of the middle Yuba, in a spur about as romantic as any to be found in a region celebrated as it is for beauty and variety, not to say grandeur, in the way of scenery.

At this point, three miles north of Columbia Hill, is situated the claim of

THE MINERAL POINT COMPANY.

It consists of 1,200 feet on what is known as the Syp ledge, and is owned by Messrs. Patton, Schmidt and others of Columbin Hill and vicinity. The claim has been laid bare at several points by cuts, and more fully opened by a tunnel which the company are now vigorously driving, having commenced the same on the north side of the above mentioned ridge, some 300 feet below its brow, and are following the lode into the hill. Although granite is found close at hand, the walls are a species of bard slate, showing a thickness of lode from three to five feet. The quartz is of a bluish cast, prospects exceedingly well in fine gold, while but little can be seen without the aid of a glass, indicating a general diffusion throughout the rock. Sulphurets, both of lead and iron, such as are to be seen in the mines of Grass Valley, appear here in considerable quantities.

The company have several tons of their rock ready for crushing, but have not yet had any test made by mill process. An assay of some of the quartz, taken from near the surface, was made sometime since by Mr. J. J. Ott of Nevada City, which resulted in a return of \$56 per ton.

Many other locations have been made on this ridge and opened to some extent; of these, the Comet and the Hubbard have a joint tunnel some 460 feet in length, which is expected soon to cut their lodes at a depth of about 300 feet from the surface.

The only other claim requiring a more extended notice, is that of

THE EUREKA COMPANY.

Owned chiefly by Hawley & Bros. of Columbia Hill, and consisting of 1,600 feet. The lode varies from three to fourteen feet in width, with a direction from north to south, and a dip to the east—the usual dip and direction of all the veins of the neighborhood—and contains in certain portions of the mine very rich bodies of ore. The gold bearing sulphuret is also seen here in considerable quantities. Some tests made by the mortar of picked rock have given results truly wonderful; but as this method was not deemed a proper criterion for estimating its value, the figures are withheld. Five tons taken promiscuously from the tunnel, yielded at Stiles' mill, Nevada City, \$53 per ton.

In consequence of this test, and the promising character of the lode, which has been laid open by two tunnels, the upper being 100 feet in length, and the lower 150. The company have erected a 5-stamp mill, with arrangements for five stamps more, should they be required, (as doubtless they soon will be,) and have put up one of Crall's waltzing pans—all now in running order and propelled by the common "hurdy gurdy," similar to those seen at the cement mills in the vicinity of You Bet. The novelty, as well as the effectiveness of the pan, consists in the revolution of each grinder on its own axis, while it has a general motion in company with its little sisters around a common center, similar in every respect to the diurnal and annual movement of the planets. "On with the dance!" Who cares for the "dust?" The more, the better.

THE GRAVEL DEPOSITS.

Covering the extensive area already alluded to, speaking generally, are rarely surpassed or even equalled by any hitherto visited in point of vastness, variety or value; in depth, varying from 25 to 400 feet, while the width in many instances may be measured by thousands of feet. The coarse gravel of different colors, including the blue, is found in numerous cases near the bed rock, running in thickness from a few inches to many feet, sometimes cemented, and in all particulars resembling an ordinary river deposit, even as respects its barren spots, rich bars or richer crevices; while above this come layers of quartz gravel, sand, pipe clay and red loam, and sometimes the whole overtopped by what is unmistakably a volcanic deposit, with but little appearance of having been subjected to the action of water for any considerable length of time. In this particular, as in all other characteristics, it is wholly different from all the underlying strata. No gold is found in this deposit. The middle strata always pays well for hydraulic washing, wherever there is a sufficient fall and a good outlet for the tailings; while the first or lower, is often exceedingly remunerative, and pays well for drilling.

The yield from each claim, depends so much on its situation, facilities and mode of working, fall, outlet and such a variety of causes, aside from its mineral value, that while under some conditions no return can be had before the obstacles are removed by a considerable outlay of capital; under other circumstances, \$10, \$20, and in rare instances, \$100 per day to the hand have been realized.

Where the conditions are anything like favorable on Mt. Badger Hill, Relief Hill, Moore's Flat and other points, \$10 per day may be considered a low average, even of hydraulic washing at Columbia Hill, where they are embarrassed for the want of a sufficient outlet for their tailings, the claims have paid in the gross, as I was informed, principally by the owners, from \$2,000 to \$12,000 per month, and have netted from \$5 to \$15 per day to the man; and in certain instances have run as high as \$40 per day. Some better idea of their true worth may be formed from the amount paid monthly by some of the leading claims for water alone. Claim of Mr. Wm. Weighel about \$3,500; Woods & Co. \$1,100; Nixon & Co. \$3,000; Nichols & Co. \$3,000. The claims of Nuttall & Co. and Trude & Co., are paying similar amounts.

When it is remembered that these companies are but skinning off the upper and poorer strata, and leaving the temptingly rich stores nearer the bed rock for future operations, requiring much larger outlays of capital, the result is truly astonishing. These immense gold deposits, many miles square, and in places not less than 350 feet deep—said to be capable of affording profitable employment for seventy-five companies—lying, as they evidently do, at the junction of two distinct channels; the one coming in from the direction of Moore's Flat, the other from Grizzly Hill, where the blue gravel makes its appearance, cannot be searched and advantageously worked except by means of large tunnels, hundreds if not thousands of feet in length, to be cut through the hardest class of slate or granite, from the banks of the South Yuba, and that too at great cost; which, however, must consequently afford a large field for the investment of capital, with the almost certain promise of both speedy and profitable returns. The same may be said, with a little qualification, perhaps, of Cherokee, three miles west, and Lake City, North Bloomfield and other points to the east, the details concerning which must be omitted, as this letter has already grown quite too long. At Woolsey's Flat, near the most northeastern point of the section described, Messrs. Mills, Reid, Shultz, Wells and others, are said to be doing well, while at Moore's, the locality from which I now write, there are several claims considered very valuable; one at least, belonging to Mr. J. M. Hickey, paying as high as \$40,000 in a single season; and being in most respects similar to those of Columbia Hill and North Bloomfield, but laboring under less impediments as regards an outlet, and generally possessing greater present facilities for advantageous working. Interesting statistics concerning these places, I should have been pleased to record, but for the same reason already assigned must forgo, being limited to one general statement which in itself speaks volumes for their past prosperity, inspiring hope and confidence for the future. Mr. W. D. Loog, a large and successful operator in the mines here, assured me that the gold yield, the greater portion of which had passed through the Baking House of Marks & Co., had averaged, during the past ten years, in the neighborhood of \$1,000,000 per annum.

As Orleans Flat, one of the chief sources of supply, has been in a measure worked out, the amount has now fallen a little short, but will probably reach, the ensuing season, some \$600,000 or more.

Hoping that this place may continue for long years to pour forth its glittering streams into the great arteries of trade, after first gladdening the hearts of many here, and that the prospects of my friend Moore, of the Moore's Flat Hotel, who, in the double capacity of both landlord and lawyer, seems to handle a brief or bill of fare with equal grace, and to give full satisfaction alike to guest or client, may continue to grow more and more flattering, I subscribe myself, as ever, a

PROSPECTOR.

Moore's Flat, August 1st, 1866.

If our readers will consult their maps of South America, and trace up the course of the gigantic river Amazon, they will find one of its principal, perhaps its most important affluent, to be the river Ucayali, which rises among the Andes of Peru. It is a long and, in its lower part, a broad and wide stream. Its banks are occupied here and there by Indians, some of whom are partially civilized, and who do a little to the way of commerce. This is carried on with the towns lower down the river, or on the Amazon proper, through means, not of boats or steamers, but rafts of light wood, on which are placed bales of *cinchona* bark, from which the medicine known as *quinine* is made, bales of deer skins, sacks of maize, etc. The Indians are fond of pets, such as monkeys, parrots, etc., and almost invariably have a collection of them on their rafts—each one of which, with its wild owner and his scarcely less wild companions, is a real curiosity—a traveling menagerie.

If you have but ordinary capacity, and will set to work with heart and soul, and stick to it, you can do almost anything.

Scientific Miscellany.

ALCOHOL AND ITS PROPERTIES.

There are various kinds of alcohol. Common vinic alcohol is produced by the fermentation of any saccharine matter, and constitutes the intoxicating principle of all "spirituous liquors." The proportion of alcohol in brandy is about 53 per cent.; in rum, 72; in whisky, 59; in port or sherry wine, about 21; in ale, 10 to 11; in cider, 6 to 7.

It is very difficult to obtain a perfectly pure alcohol, on account of the strong affinity which it has for water. It cannot be obtained by distillation, except in the presence of some substance which has a stronger affinity for water than it has itself. The proof spirits of commerce contains but 48 per cent. of absolute alcohol; rectified spirits, 83 per cent.

Pure alcohol is very mobile; hence it is used in spirit levels. It never freezes, even in the most intense cold; hence it is used in thermometers for low temperatures. It is very inflammable. Powder, when wet with under-proof spirits, will not explode, on account of the water present with the alcohol; when wet with pure alcohol it explodes readily, showing the absence of water and the proof of the alcohol. Pure alcohol is exceedingly volatile, and if poured into a jar of oxygen gas, forms a powerfully explosive vapor. It is burning and dry to the taste, owing to its power of rapidly abstracting moisture from the tongue, or any other animal tissue. It does not conduct electricity.

A singular mode of concentrating alcohol is sometimes employed, founded upon the above-mentioned fact that it will not moisten animal tissue. If a bladder, filled with 90 per cent. alcohol, be hung up for a few days in a worm room, it will be found to have increased its percentage from 90 to 97. The water has permeated the bladder and evaporated from the outside; but as the alcohol will not moisten the tissue of the bladder, it cannot get through, and consequently remains behind freed from 7 of the 10 per cent. of water which it contained. When the alcohol of commerce is exposed to the air, it gradually absorbs oxygen, and acetic and other acids are formed. Under the influence of these acids it loses an atom of water, and compounds are formed called *ethers*. Upon this principle ethers are manufactured, varying according to the acid employed. The uses of alcohol in chemistry and pharmacy, are numerous and important. Its manufacture is one of the most important arts, and forms the basis of a great number of the other manufactures. Alcohol consists of carbon, hydrogen and oxygen. Its formula is $C^4 H^6 O^2$.

THE IRISCOPE is the name given to a new instrument which has recently been invented, and by the aid of which an individual is able to see all that is going on in his own eye. It is simply an opaque shell to cover the eye, pierced to the centre with a very small hole. On looking through steadfastly at the sky, or at any diffused light, the observer may watch the tears streaming over the globe of the eye, and note the dilation and contraction of the iris, and even see the aqueous humor poured in when the eye is fatigued by a long observation. It is needless to say that with the aid of this instrument a man can easily find out whether he has a cataract or not. If he has, he will only see a sort of veil covering the luminous disk which is seen by a healthy eye. The instrument is certainly simple and curious, and will no doubt excite attention in those who are anxious to know more of themselves. An "iridoscope" that will give a very good idea of what a more perfect instrument can accomplish, may be readily extemporized by making a hole with a fine needle in the bottom of a small pill-box.

GLASS.—By carefully attacking glass with hydrofluoric acid microscopic crystals are developed, which proves that we are not yet acquainted with the true composition of this substance. The crystals vary with different glasses.

CURIOUS EFFECTS ON THE VISION.—"Santolina" is the botanical name of a flowering plant found in the south of Europe, an extract of the flowers of which is sometimes used as a vermifuge to drive away insects from wardrobes. The flower itself, when dried, is sometimes sold as a substitute for *camomile*. The juice of the plant has sometimes been applied as a remedy for weak eyes. Quite recently it has been ascertained that the acid, known as santonic acid, on extract from the flowers of this plant, produces a most singular effect upon the organs of vision, when taken inwardly. A Paris physician has discovered that when a dose of eight or ten centigrammes has been taken, a species of intoxication is produced, during which all objects seen appear to be yellow; when a stronger dose is administered, everything assumes a violet-colored hue! This remarkable property has induced M. E. Rose, the chemist, to make some examinations into the character of this acid, by means of the solar spectrum. The results of these examinations have not yet, so far as we have learned, been fully communicated to the public; possibly they have not yet been fully completed to the satisfaction of the experimenter. Chromatism and achromatism, as applied to the vision, are not yet fully understood. It is well known that they may be modified by a variety of circumstances, and have not yet been subjected to any general law. An investigation into the singular effects above described, of this well known extract of *santolina*, may possibly lead to some important discoveries with regard to the visual organs.

WHAT WE EAT.—Chemistry makes some queer revelations. Take, for instance, the common article of table-salt, one of the few things in nature which is considered absolutely essential to our existence. Salt is a compound of one atom of the metal sodium, and one atom of a greenish yellow gas called chlorine. Sodium is the dangerously active compound with which miners have of late become so familiar, by reason of its forming a valuable amalgam with quicksilver. A small quantity of this metal, when placed on the surface of water, and kept in one position for an instant, produces a violent explosion. If you place a few grains of it in contact with two or three ounces of quicksilver, and warm the quicksilver a little, an explosion will follow as loud as the report of a pistol, producing a volume of flame like the explosion of gunpowder. It is a dangerous experiment to try. The result is a compound metal nearly as hard as black tin. This sodium, as we have already said, is one of the equivalents of salt; the other equivalent is chlorine gas, one of the most powerfully corrosive gases known. This gas dissolves gold. Now, when you have eaten fifty-eight ounces of salt (and it don't take a very long time for a person to consume that much), you have taken into your stomach twenty-three ounces of sodium, and thirty-five ounces of chlorine gas! Some people will consume nearly or quite a full ounce of salt every day—that is, a little over one-third of an ounce of sodium and a little less than two-thirds of an ounce of chlorine gas combined. An infinitesimal part of either, taken separately, would produce instantaneous death.

LINOLEUM.—A substance is now being manufactured from flaxseed called linoleum. It is said that it will supersede India rubber—which it very much resembles, and of which it possesses most of the properties—in the various manufactures of water-proof clothing. It can be used for the coating of iron or wood, or for coating ship bottoms. It is as good as common cement, having properties similar to the marine glue made from India rubber and shellac. It is readily vulcanized by exposure to heat, and by this means becomes as hard as the hardest wood, and capable of a fine polish. The variety of uses to which it can be applied in this form will at once suggest themselves to the reader. Hitherto it has been made solely to produce floor cloth, for which it is well adapted.

CARBONIC acid has been resolved by Mr. Deville into an explosive mixture of carbonic oxide and oxygen. The transformation was effected at 2,372° Fahrenheit.

NOCTURNAL GROWTH OF PLANTS.—M. Duchartre, of Paris, has recently been making some careful comparative experiments designed to show the relative growth of plants by night and by day. It has generally been taken for granted that plants grow more rapidly during the daytime, but exact measurements have not often been made, and the results of the few botanists who have given attention to this point are contradictory and unconvincing. M. Duchartre made continuous observations during the month of August of last year, upon six plants, belonging to different families, and growing in the same soil under normal conditions, but without any special care. The plants were a grape-vine, a hollyhock, a strawberry-vine, a hop-vine, and two varieties of gladioli. The elongation of each plant was measured three times a day—at six A. M., at noon, and six P. M. At each time of observation the general atmospheric conditions and the state of the thermometer were noted. The result of the observations thus made was, with very few exceptions, the growth between six P. M. and six A. M., was much greater than between six A. M. and six P. M. In many instances the elongation of the shoots during the night was double or triple that during the day. M. Duchartre offers at present no explanation of these phenomena, and does not venture to affirm that what was true of his six plants is true of all plants, at all seasons and in all stages of vegetation. He calls attention to facts which must be multiplied before any general conclusions can be based upon them, and he urges all persons, in connection to prosecute such researches, to accumulate observations for the elucidation of the law of diurnal and nocturnal growth.

BLACK RAIN.—The *Aberdeen* (Scotland) *Journal* gives the following account of the black rain showers which are now so well known in Scotland, and which scarcely occasion greater astonishment in the regions where they occur than would a snow storm in New England:

Between the beginning of January, 1862, and the middle of January, 1866, there have been no fewer than eight authenticated black showers in Scotland. Seven of these fell in Slais, and the extensive surrounding district. Two of them were accompanied with pumice stones, some of the balls measured eight to ten inches in diameter, and weighed upwards of a pound avoirdupois. The first four, including the Carluke shower, and the eighth, were contemporaneous with outbursts of Vesuvius, and the intermediate three with those of Etna. But now, through the instrumentality of the Rev. Mr. Rust, of Slais, who was the first to draw general attention to the Scottish showers, it has been discovered that England gets her share, likewise, of black showers, although she did not think that she was so distinguished. On the 3d of May, of the present year (1866), the town of Birmingham, and the surrounding country, were twice, for three-quarters of an hour, each time, enveloped with black clouds producing darkness and rain. Accidents took place in the streets; vehicles were upset, gas bad to be lighted at some of the crossings, and nearly in all places of business. Mr. Rust, writing for information, got inquiries instituted, and the result is found to be that a large quantity of black rain, similar to the Scottish, fell, and blackened rain water in tanks, and clothes on greens, not only in Birmingham itself, but at rural places many miles distant, unaffected by soot and smoke, and even windward of the town. So far as known, however, no word has yet arrived of any volcanic outburst, although, judging from what has taken place in Scotland, a probability exists that some volcano has been in a state of activity, emitting its contents, whether it be heard of or not.

STENOGRAPHY ADAPTED TO HEBREW.—Successful attempts have been made in Germany to apply Arend's system of stenography to Hebrew. Verbatim reports of speeches delivered in that ancient language have already been made at Luxembourg.

SOMETHING NEW IN PHOTOGRAPHY.—It has been discovered that simple pressure of raised surface upon a sensitized photographic plate will produce an image. The whole is performed in the dark, and mechanical means thus made to produce the same effects as light.

THE BOTANISTS OF EUROPE, taking advantage of the International Horticultural Exhibition in London, have come together in a Botanical Congress, which is presided over by the famous Caudex.

SAN FRANCISCO, SATURDAY MORNING, August 18th, 1866.

There is no decided change to note in the condition of the Money Market, although the applications for discount in Bank this week are thought to be rather less numerous than for some time past, and greater ease may now be anticipated.

The outflow of specie has been materially checked, and the demand for remittance East is not likely to be as large in the future as it has been for the last two months.

Receipts of Treasure from domestic sources, since the date of our last report, have been rather larger than usual, and exceeded \$1,600,000, making an aggregate of \$3,000,000 thus far during the current month.

The market continues to be well supplied with Bullion and the demand not active for shipping purposes. Gold bars are quotable at about 840, and silver is ranging at ½@¾ cent. discount for average grades.

Currency Bills on the Atlantic are offered at 44 ½ cent. premium on gold. Sight Drafts payable in coin are selling at 2¼ cent. premium, and Telegraphic Transfers are made at 4 ½ cent. premium. Sterling Exchange is quoted at 48¼@48½d. for best Bankers' bills.

Legal Tender Notes are dull and inactive, and trifling sales were made at 71½@70½c., closing at 70½c. bid. Our latest telegraphic advices from New York, to the 16th inst., quote Gold at 151½@151¾.

The following suggestions from the last annual report of the President of the Savage Company commend themselves to the consideration of those interested:

"All mining enterprises on our coast have so many interests in common, that it seems to me there should be cultivated a mutual and better understanding between those engaged in the various branches of mining, and particularly with those companies engaged in the production of the same metal. Organizations have always existed by those engaged in like occupation, for the purpose of information, advancement, and protection. Mining officers have committed to their care and management a vast amount of very valuable property; therefore, to give proper direction and obtain the advantages of experience, it would be well that they form themselves into an association, for the purpose of exchanging the knowledge and experience acquired in the modes of working mines; the manner of treating ores; systematize the price and management of labor; to adjust questions that may arise between companies, and devise proper means of defense against blackmailing attacks and malicious trespasses. Much good and certainly great improvement might grow out of such an organization."

The Mining Share Market has been somewhat depressed this week, and with scarce an exception every stock on the list was sold at a decline. There seems to be no material abatement in the yield of Bullion from prominent claims, and so far as we can learn there have been recently no unfavorable developments worthy of special mention.

Hale & Norcross has met with no sales this week. This stock is now rarely offered, being in the hands of strong holders who are indisposed to sell except at full rates. From the 1st to 12th inst., 1170 tons of ore were delivered at different mills, and 65 ½ cent. of the assay value of which has averaged about \$50 per ton. A dividend of \$75 per foot was paid on the 15th inst.

Savage has been dealt in at fluctuating rates, declining from \$1200 to

LABOR VS. CAPITAL.—The conflicts between capital and labor, which have been of such frequent occurrence during the past eighteen months, both in England and in our own country, clearly indicate the necessity of a better understanding between the employer and the employed. Our English cousins seem to be more alive to this great reality than our own countrymen; perhaps from the fact that the consequences fall heavier upon them than upon us. Especially has this been the case since the inception of the great emigrant aid scheme, by which English skilled operatives, whenever they are dissatisfied with their condition at home, can find free passages to the United States, where plenty of work and higher wages than they would presume to ask for in England, constantly awaits them. To prevent this disastrous loss of laborers, the English manufacturers have successfully introduced a system of sharing with their operatives all the profits which may accrue to the employer, after paying a liberal percentage on the capital invested. We have never heard of this plan having been adopted in the United States; but several cases have occurred here where the workmen have protected themselves; as, for instance, at a recent disagreement between the employers and employed at the Troy (N. Y.) iron mills, the workmen have banded together for the purpose of carrying on the business on their own account, so as to secure all the profit to themselves. This undertaking is eliciting no little comment from the Eastern press, and if the experiment proves successful, it will probably be repeated at other localities.

THE BRITISH NORTH AMERICAN PROVINCES. As an evidence of the want of liberality and energy with which the industrial operations of the British North American Provinces are managed, we may state that all the iron which is there employed, for railroads and for mining and other operations, after being transported 3,000 miles from England, is loaded and much of it remelted and cast at the very site where thick beds of Nova Scotia ore may be actually seen protruding from the earth; and where a vein of coal thirty-six feet in thickness is ready at hand and inviting the labor to take it out to supply fuel for making, for that use, the iron which is brought at so much expense across a broad ocean. Again, the English steamboats, which run into Chigocto Bay, in Nova Scotia, are propelled by coal imported from Great Britain, while the hulls of those very boats often pass within a few feet, and sometimes directly over an extensive coal strata, from which they might readily be supplied, even by the very crews which navigate them. In fact, it is said that small vessels from the United States do not unfrequently run into that bay (where the tide rises and falls about fifty feet), anchor directly over the coal strata, and when the tide goes out fill up with coal from the seams which are uncovered by the rising water! Is it a matter of wonder that the Provinces are seeking annexation to the United States?

By Express.—Two cents per copy will be added to our usual rates of subscription (to pay Wells, Fargo & Co.'s tariff) on papers sent by express. If connecting expresses in the interior make additional charges, subscribers must themselves settle the same.

MINING AND SCIENTIFIC PRESS

PATENT AGENCY.

For the Pacific Coast.

OFFICE OF THE MINING AND SCIENTIFIC PRESS—No. 505 Clay street, corner of Sansone, San Francisco.

Information for Inventors!

Inventors on this coast having their applications for patents made out through our Agency can sign their papers at once, and thus secure their rights at least three months sooner than by sending the same to distant agencies, situated in New York or Washington. The first question that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is to submit his plans to a competent and experienced business of obtaining patents, and solicit their opinion and advice. If the inventor consulted are honorable men, the inventor may safely obtain his ideas to them, and they will inform him whether or not he is entitled to a patent, and whether or not he should retain his rights in his own hands, or whether he should apply to the Government for a patent. These who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to visit them by mail, or through the Mining and Scientific Press. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent, together with a return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Caveats.

A caveat is a confidential communication made to the Patent Office, and is therefore filed with its secret archives. The privilege secured under a caveat is that it entitles the inventor to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat. The caveat is not required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from \$10 to \$20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. Englishmen, Frenchmen, and Americans, who have obtained every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States. To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings, and charges for procuring a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from \$20 to \$40. If the patent is granted no further agency expenses ensue. If the application is rejected, we can advise the inventor to investigate the reasons presented to the Commissioner for refusing the patent. In making this examination, our Washington agent has access to all the drawings, models, books, and specifications filed in reference, and we report the result as early as possible to our client.

If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent granted. For this purpose, the inventor should be charged a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable, and satisfactory to both parties, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal chance of securing a patent. For this reason, we have been and are prosecuted in the best manner, by experienced attorneys, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by inexperienced attorneys, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases, such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, name, Lab. Press & Co., Mining and Scientific Press, No. 505 Clay Street, corner of Sansone, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on New York, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc., to the Patent Office. The inventor should be notified of the state of their application in the Patent Office, when it is possible for as to do so. We do not require the personal attendance of the inventor, unless it is one of great complication; the business can be handled by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get cases through in less time, but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance.

The following is the Government tariff of fees established by law:

On every application for a design, for 3 years and 6 mos.	\$10
On every application for a design, for seven years.	15
On every application for a design, for fourteen years.	30
On every application for a patent, for seven years.	15
On every application for a patent, for fourteen years.	30
On issuing each original patent.	20
On filing a disclaimer.	10
On every application for a re-issue.	30
On every additional patent granted on a re-issue.	30
On every application for an extension.	50
On the grant of every extension.	20
On appeal from the Commissioner of Patents to the Court of Appeals.	10
On every appeal to the Judges of Circuit Court, D. C.	25

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

N. B.—We make out our own forms for applications, etc., and provide respectfully inform all parties that we have no printed blank forms for sale.

DEWEY & CO., Agents,

Mining and Scientific Press Office, No. 505 Clay street, corner of Sansone, San Francisco.

Pacific Mail Steamship Co's

THROUGH LINE TO NEW YORK,

Carrying the United States Mail.

LEAVE FOLSOM STREET WHARF, AT 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers for ASPINWALL for New York.

On the 10th, 18th and 30th of each month (but has 31 days).

When the 10th, 18th and 30th fall on Sunday, they will leave on Saturday preceding; when the 18th falls on Sunday, they will leave on Monday following.

Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.

Departures of 15th or 19th connect with French Transatlantic Co.'s steamer for St. Nazaire, and English steamer for South America.

Departure of 10th connects with English steamer for Southampton, and P. R. R. Co.'s steamer for Central America.

Departure of the 30th connects with English steamer for Panama, the port of the new lines.

The following steamships will be dispatched on dates as given below:

August 18th—SACRAMENTO. Capt. J. M. Gavarly. Connecting with HENRY CHAMBERLAIN, Capt. Gray.

August 24th—GOLDEN AGE. Capt. E. S. Farnsworth. Connecting with NEW YORK, Capt. Hurd.

Cabin passengers berthed through. Baggage checked through and pounds allowed each adult.

An experienced surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Inman Line, can be obtained at office P. M. S. S. Co., San Francisco.

For Merchandise and Freight apply to Messrs. WELLS, FARGO & CO.

The splendid steamship COLORADO will be dispatched for CHINA on TUESDAY, January 1, 1889.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

FAIRBANK'S

HAY,

COAL,

CATTLE,

Mining Summary.

CALIFORNIA.

Alpine County—

The Silver Mountain *Bulletin* of August 4th, has the following items: D. N. McBeth has leased the O. K. mine from the shareholders (himself being one) until the first day of June, 1867, and commenced operations thereon. There is no water in the mine at the sixty-foot level, and after the hoisting works are erected, paying ore can be taken out within two weeks.... The George Washington company have leased for two years, with the privilege of a renewal, D. Davidson's steam saw-mill, situate about one mile below town, which will be converted into a quartz mill.... There is a 40-horse power engine connected with the mill, in addition to the water-power furnished by Silver Creek, which will be ample for the purposes of the company.... The indications in the Mountain tunnel are that a ledge is near. A considerable stream of water followed a blast a few days ago.

The Alpine *Miner* of 11th instant says: In the Mullan the boys are down seventy-eight feet with their shaft—as fine a piece of work as can be found in any county. For the last few days the work has been in a decomposed quartz, which leads to the hope that they will soon strike the solid ledge.... Some thirty-five men are at work on Davidson's saw-mill, which is to be converted into a quartz mill, with roasting furnaces and barrel apparatus, for the George Washington company.... The drainage of the creek from the point where the American lode crosses, has laid bare a portion of the croppings before concealed, proving the lode to be wider than heretofore supposed. Alpine county now furnishes her own lime.

Amador County—

The *Ledger* of August 11th has an editorial on the subject of "Our Undeveloped Mines," in which it suggests to those who desire to invest, that they may often get as good a mine for a few hundred dollars expended in developing a lode on shares, as they would get for as many thousands expended in the purchase of one already developed. We quote: "Amador county now contains about twenty-five operative quartz mills, running over 400 stamps, and crushing about one hundred and twenty-five thousand tons of ore annually. The number of thoroughly developed and well proven mines does not probably exceed forty; these, with the proceeds of some twenty or thirty others in progress of development, yielded not less than two millions of dollars. And yet no one knowing anything of the subject would hazard his reputation by denying the assertion that for every paying mine in the county ten equally valuable ones might be developed within two years time. All that is required is properly directed labor and capital. We would enumerate a hundred good prospecting lodes—lodes that are as promising in all respects as were the richest—lying idle from sheer inability of the claimants to work them. * * There are many persons holding claims on lodes, and have been for years, who would be glad to have them prospected, and give the prospector from one-half to four-fifths for their outlay, and the cost would rarely exceed from one to five thousand dollars."

Butte County—

The *Record* says: In addition to the ledge of iron ore, which we noticed as having been located last week, we understand that another claim has since been located, and also a cinnabar claim. The iron vein has been traced in a southerly direction from near the southern boundary line of Plumas county to a point on the south side of Feather River, near Bidwell's Bar.

Calaveras County—

The Copperopolis *Courier* of the 11th inst. has these items: The quartz claim of Messrs. Thorn & Irvine, situated at Rich Gulch, near the Mokelumne river, cleaned up twenty-four ounces last week, from two tons of rock crushed in an arrastra.... From eight tons of rock taken from Willis & Co's claim, at West Point, \$1,023 were extracted.... Work in the Napoleon is steadily progressing. Fifteen men are now engaged in and around the mine.... Tom McCarty, of the Log Cabin, struck a promising lead not long since, about four miles from the cabin. The rock is rich, and the lead well defined.... The new engine house on the Union claim is a fine and substantial structure. The engine is now running like clock work.

The *Chronicle* of same date has the following: We are informed that another lead of pay dirt, the existence of which was not suspected, has been recently struck in the American shaft.... Charles Ghoulson has just discovered a "bunch" in his claim, with ore worth \$120 per ton.... Johanson & Willis have rock worth \$140.

Los Angeles County—

The *Alta* of Aug. 10th, has an article from which we quote: The oil districts are looking up. One of the San Buenaventura mines has suspended work for a short time in consequence

of the difficulty of keeping employees. They have plenty of oil, but the gas is so strong in the tunnel that workmen cannot be induced to continue the labor. When, however, a chimney is cut in the tunnel for ventilation, the mine can be readily worked. In this county we not only bore for oil and dip it up from springs, but run tunnels for seepage, and follow the vein in the same manner nearly as in mining for ore. The Pioneer Oil well has gone through three hundred and eighty feet, and struck a vein of water which flows out, at forty barrels per hour.

Mariposa County—

The *Gazette* of Aug. 11th, says: The large quartz vein immediately below the town of Coulterville was sold Thursday last by Mr. J. F. Johnson, to some capitalists for \$10,000. Four thousand dollars of the above amount was paid down, and the balance to be paid if the vein proves satisfactory to the purchasers.... We have heard of several "good strikes" being made in quartz, the past week. Mr. Footman found a rich vein on the mountain east of Lovejoy's Mill, and Fred. Weber found another on Sweetwater.... Rumor has it that Mr. Haskell sold his interest in the Copper Lode at Buchanan Hollow. The amount he received is said to be \$22,000.

The *Free Press* of the same date has the following: Dr. McLean has commenced work on the Pino Blanco mine, near Coulterville, which he recently purchased, and contemplates putting up a mill within a few months.... We understand a party of capitalists have invested in the quartz vein west of the town of Coulterville. Rumor has it that the purchasers represent several millions of capital.

The same has an editorial on the mining progress in the county, and says that more activity is displayed at the present time than ever before since the commencement of quartz operations. It says a false impression has obtained abroad in reference to Mariposa county, that it is identified with the estate of the same name, and that, in consequence, the name has become significant of swindling and sharp practice. The article gives an "outline of the history of this great humbug, from Fremont to Dodge Brothers, saying that ostensibly the "Mariposa Company" represent twelve millions of capital; but that the valuation, as sworn to by Dodge Bros. was only \$118,750. It closes with the following: "It is about time that the public should know that the so-called Mariposa Company lacks a few acres of owning this entire county."

The yield of the Pine Tree, Josephine and Princeton mines, on the Mariposa estate, for twenty-four days in July, is said to be \$28,000. The ore extracted averaged \$9@12 per ton. *Financial Col. of Bulletin.*

Nevada County—

We clip the following items from the *Gazette*: We learn that a large amount of prospecting for quartz is now being done in the vicinity of Omega. Quite a number of ledges have been found which show free gold, and the prospects of some of them proving valuable are very flattering indeed.... We were shown yesterday some fine specimens of sulphuretted ore from the Federal Loan ledge, situated about three miles above Nevada, on Deer Creek. The specimens were taken from the shaft, at a depth of one hundred and sixty feet, and where the ledge is about three feet in width.... We learn that the Oriental mill, which has been idle for some weeks, will be started up again this morning (10th) on rock from the Willow Valley ledge. The company now have out about seventy-five tons of rock, and purpose making a run of a hundred tons before cleaning up. They will probably take out rock enough to keep the mill running steadily.... R. W. Latta brought down from Washington, on the 13th, a nugget of pure gold, weighing nine ounces, and valued at \$160. It was found a short distance above Washington, in a ravine putting down to the Yuba from Gaston Ridge. This ravine had never been worked until within a year past.... The new mill at the town of Carlisle is nearly completed, and we learn will be started up next week. The first rock crushed will be from the Grant ledge.

A gentleman from Omega informs us that A. T. Fry, James Spring and others, have been working for some weeks past on a ledge which proves to be an extension to the "Fidelity" ledge, a few miles above Omega. They had sunk an incline on the ledge to the depth of twenty-five feet, and on Wednesday last struck very rich rock in the bottom of their incline where the ledge is about three feet wide. Our informant states that a man could make twenty dollars per day by pounding up the rock in a hand mortar. The discovery is on Diamond Creek Hill, about three-fourths of a mile from the Fidelity Works, on the South Yuba.

The Grass Valley *National* has these items: The Redan Mine, on Oshora Hill, which has been lying idle for two or three days past, in consequence of the breaking of portions of their pump, resumed work yesterday morning, the breakage having been fully repaired.... Schardin & Co. have struck a very fine ledge

in their claim at the head of Cornmeal ravine, near Newtown. The rock shows large deposits of free gold, and otherwise looks very promising.... A very handsome ledge has been struck in the Gem mine, at Eureka, owned by Messrs. Curtis & Hunt. The rock will average \$40 to the ton.

J. S. Crall recently sold a one-twelfth interest in the American claims, at Sebastopol, a short distance below North San Juan, in this county, for \$22,000 in gold.—*Grass Valley Union.*

The *Transcript* of 11th inst., says: The shaft in the Italian mine is now down fifty feet. The ledge is over two feet wide, and well defined. The rock is studded with free gold, and the next crushing will pay more than any yet. The last lot worked paid \$72 per ton. Wherever this ledge has been tapped on either extension the rock is of the same character, giving indications of great richness.

EXCELSIOR.—The *Union* says: We published a short time since an item from the Meadow Lake *Sun*, announcing that the Enterprise Mining Company had repudiated the contract with Goss & Lombard, of Sacramento, for crushing their rock. We are authorized to state that this is not so, and that the mill is already at work crushing the rock of the company under the contract which was originally entered into.... Twenty-nine tons of rock from the mine of the Mohawk and Montreal Company, at Meadow Lake, recently crushed at Winton's mill, yielded a bar of gold weighing fifty-one ounces, and worth over \$800. This was from the free gold, there being saved some six tons of sulphurets yet to be reduced, which will yield \$35 or \$40 a ton, thus bringing the total yield up to some \$38 a ton. So says the *Gazette*.

The *Sun* has the following: We paid a short visit to the Excelsior mill to-day, and found its construction rapidly advancing. The pans and pan-shaft are in their places ready for work. The batteries are fully completed; and next Thursday, when the balance of the machinery is expected to arrive, every thing will be immediately placed in its proper position, and the mill ready for work.... Rich surface diggings have been struck near Bowman's ranch, on the Denness road. A ledge called the American, has also been discovered in the same vicinity.

The Grass Valley *Union* of August 11th, says: We believe that the mining district in and about Meadow Lake embraces some excellent quartz lodes, the richness and extent of many of which has been satisfactorily demonstrated by assay and mill process. But time, capital, patience and industry are required in developing any quartz region, and Meadow Lake can prove no exception to this rule. In another year, or perhaps two or three years, we predict that Meadow Lake will have at least half a dozen extensive, dividend-paying mines, which will give employment to hundreds of men, and thus furnish a substantial business basis for a prosperous mining town.

Placer County—

The *Stars and Stripes* of August 15th, says: Subscriptions come in slowly to the Auburn quartz mill, yet more rapidly than some of its projectors hoped. About \$4,000 have been subscribed, and there is now no doubt that the mill will be erected. Hurry up, friends, and let us have the mill to grinding right speedily, for so much goodly quartz waiteth for its operation.

Plumas County—

Yesterday, says the *Quincy Union*, August 11th, we were shown 100 ounces of gold taken from sixty pounds of rock from the French Ravine ledge near Rich Bar, East Branch. Mr. R. Irwin, who brought the dust out to send it to the mint, informs us that the rock was crushed in a hand mortar, and the above statement as to the number of pounds crushed and the amount realized, is correct.

Sacramento County—

The Nevada *Gazette* of August 9th, says: The new quartz mill of Palmer & Day, of Folsom, is about ready to start. It is situated on the Placerville road, half a mile above White Rock, on the Jersey Blue Ledge. They have a large quantity of good rock out, and a mine which at Grass Valley would sell for \$250,000.

Shasta County—

The *Courier* of August 11th has these items:—Encouraged by the rich prospects obtained from the Harrison lode, the Mammoth Company have decided to start their mill again next Monday.

Letter to the same from Roaring River, dated August 5th, says:—No greater field for profitable investment of labor and money in mining exists anywhere than in this Roaring River and Gas Point region.... Many claims have been opened, and work begun with hydraulics with a pressure of from forty to sixty feet; not enough to cut the hawk fast enough to make it profitable, though wages have always been realized, and in many instances small fortunes made when a soft streak could be found. The experiment of getting the dirt

down by means of powder is now being tried by a company here and with flattering prospects.

Sierra County—

From the Mountain *Messenger* of August 11th, we clip the following:—For our own satisfaction, we tested four ounces of Good Hope rock in which no gold was visible, and from it, much to our astonishment, we obtained nearly half a troyounce of fine gold.... Wm. Fisk, Esq., of Eureka, has sold out his ditch property to the Derrick mining company.

Editorial correspondence same, says of the Bear Valley mines: At the Lacony several companies have been prospecting by sinking shafts. The General Grant is down about sixty feet. The ledge prospects well, both in silver and gold. There are but few miners working in this district.

Letter to same from St. Louis, says: The mines, so far as I can learn, are yielding well this season, rather above an average, I believe, of preceding years. The Union Water company are extending their ditch from this place to Poverty Hill and Scale Diggings, about twelve miles distant from this place. This ditch will be the means of developing more mining ground than has ever been worked in Sierra county up to the present time, and I am inclined to think that Mt. Pleasant ranch will yet be the heart of a large mining town.

Gray & Herricks, of Gold Valley, have apparatus completed for working their ore on a new plan, by which they expect to add fifty per cent. to the yield. It assays \$200 to the ton.

Trinity County—

The *Journal* of 11th inst. has this item: We saw a sight worth looking at in the vault of Greenwood & Newbauer's Bank, last Saturday evening. It was nothing less than seventeen hundred ounces of gold dust, taken from three claims in the Weaverville Basin, and valued at over twenty-nine thousand dollars. This is not intended as a sensation item; similar sights have been visible there every week since "washing-up" commenced. There is not a mining locality in California where work has been continually prosecuted for fifteen years, which at the present time yields as richly as the Weaverville Basin.

Tulare County—

A correspondent from Havilah, Tulare county, says mining still goes on, quietly and successfully: The Pioneer Mill, (Thomas) Rand & Co., Bigler & Birdseye, and Marsh & Kennedy, are all working regularly and successfully. Others are doing work partially, some stopping for want of rock, and others for lack of money.

Yuba County—

A correspondent writing from Rocky Bar, Yuba river, says the river miners are busy. Richards & Co. are stripping—removing top dirt—by means of a water-power railway. The Rocky Bar company (Chinese) have a splendid water derrick. Also Murkin & Co. Rollerman & Co., last Saturday night week, had their sluices robbed of a week's run.

The *Appeal* says: In a published statement of the yield per ton of fifty-one paying mines in the southern part of the State, we find but fourteen that yield better than the Pennsylvania ledge at Brown's Valley. Mr. Chamberlain, of the Hayward mine, says these mines are favorable in three essentials—the ore is cheaply raised, easily crushed, and gold saved with a small percentage of loss. Two mines of Brown's Valley are now fully developed, and can be made to yield, with the same management, as richly as the Hayward mine of Amador, reported to be worth \$1,500,000.

NEVADA.

Washoe—

The shaft in the Crown Point mine at Gold Hill, 430 feet deep, has recently been retimbered, the timbers being set in the new style, twelve inches square. A new hoisting cage has been put in and another one is nearly ready for its place. The mine is said to be yielding 1,000 tons of ore daily.... The total product of the Hale & Norcross mine for the past month was 2,729 tons of ore, valued at \$141,000. This mine has declared a dividend of \$75 per foot.... There is some improvement in the Empire Mill, and the production of this mine will undoubtedly be materially increased in the future.... During the past week 900 tons of ore have been taken from the Savage mine, and 766 tons shipped.

The Gold Hill *News* of August 10th, says: The Yellow Jacket mine is as successfully worked now as at any other time since its incorporation. The company, from their 560-foot level, are now taking out an average of 300 tons of ore per day through their north and south shafts. Scientific, systematic mining is the order of the day, and the Yellow Jacket officers know this right well. As an evidence of what we say, a fifty dollar per share dividend was declared this morning by the trustees, and there are more coming.

We understand, says the New York *Mining Journal* for July, that Mr. M. Sutro has gone to Europe to seek from the capitalists in London, the \$3,000,000 needed for the completion of the great adit known as the Sutro Tunnel.

We should have been better pleased to hear that the prosperous silver companies mining the Comstock all the way from Cedar Hill to beyond Crown Point, had clubbed together and subscribed the requisite amount.

Reese River—

The *Reveille* of 4th August, has these items: We have been informed by Robert Morrill, who has returned from the Philadelphia district, that the Silver Chamber has been developed into a twenty feet ledge. The mineral is generally of the same character—a silver copper glance, of highly variegated colors—as that contained in the Transylvania and El Dorado. Everything was progressing finely, and Buel's mill was being rapidly pushed to completion. . . . Mr. Bradley, of this city, has laid upon our table a fine specimen of red oxide of copper ore, from the Battle Mountain district, situated about ninety miles north of Austin, near the Humboldt river. It was procured from a ledge represented to be twenty feet wide.

Same paper of 7th says: Mr. Hiller, the superintendent of the Buckeye mine on Lander Hill, informs us that they uncovered the ledge yesterday at the depth of 140 feet. . . . New discoveries had been made recently northwest of the Transylvania. One of the principal ledges was called the Green & Oder, which is situated about three quarters of a mile north of the Silver Champion. The ledge is represented to be ten feet thick at the surface, and it has been traced in a nearly straight line over hills, ravines, and canons for six miles. About one mile north of the Green & Oder location, there is another claim called the Savage, where the great ledge has widened at the surface from ten to fifteen feet. Another location had been made about half a mile east of the Green & Oder, called the North Star Potosi company. . . . Fifteen hundred pounds of the ore from the Richey & Hussey, Northumberland district, will be sent to the mill for reduction.

Same of 9th says: We have been informed that the work of the Timok mine, on Lander Hill, has been unusually successful. During the past month a large body of high grade ore was developed in the mine, the handsome result of the working of which will be a dividend of one and a half per cent. on the capital stock of the company for the month of July. . . . Assays of the ore from three ledges in the Northumberland district were as follows: Welty, \$129.30 of silver per ton; North Star, \$38.56; Rough Diamond, \$120.87. . . . The Enterprise ledge, a new discovery in White Pine district, has been opened through an excavation ten feet deep, where it is three feet thick, exhibiting a brownish chloride ore, which assayed \$1,340. The General Rosecrans, Gettysburg, and Uncle Sam are old locations upon the same hill, and have all been stripped and opened by slight excavations. Samples of their ore assayed as follows: General Rosecrans, \$270; Gettysburg, \$102.09; Uncle Sam, \$788.58. On the east side of White Pine Mountain lay the Bay State and the General Lyons, the former of which has been opened to the depth of eight feet, disclosing a ledge three feet thick, and the latter by a cut three feet deep, showing a ledge three and a half feet thick. An assay of the ore from the former yielded \$113.54, and of the latter, \$440.63.

Esmeralda—

The *Union* of August 11th has the following items: The hoisting machinery now being erected by the Philadelphia company is of the best and most substantial kind, and will be ready to start up on Monday next, when work will be resumed with the utmost vigor. . . . Several sales were made the first of this week of mines in the Red Mountain district, near Silver Peak, one of the sales including the mill of Martin & Co., with the adjoining lots of land belonging to the company. The first deed is from E. G. Carpenter to Samuel B. Martin for \$30,000, the second is from J. M. Cammack to Samuel B. Martin for \$36,000, and third from J. H. Phillips and others to Samuel B. Martin for \$12,000, making in the aggregate \$78,000. . . . Mining has been resumed this week on the Crockett ledge with the intention of working it systematically and thoroughly. . . . Mining and business prospects seem to be rapidly brightening in this county, and the indications of improvement observable everywhere are generally of a more permanent character than have been witnessed here for a long time. . . . Work has been resumed on the Monroe and Thatcher tunnel. As soon as the outlet is straightened, they will commence driving the tunnel into the hill. . . . Most of the prospectors have left the new mines near East Walker, it being generally supposed now that the new lead discovered by Mr. Wilson is the only one in the vicinity. The country is well calculated to speedily demoralize a prospector.

Humboldt—

From the *Register* of August 4th, we clip the following: The North Star ledge continues improving. A shaft is going down, and in three or four days' work the ledge widened from ten inches to about three feet. The quartz is soft, easily worked, surrounding rock

soft, and a large clay seam lining the walls. A few pounds of the rock worked by mill process yielded about twenty-five cents to the pound of rock. Native silver splashes are common in the rock, and an experienced miner threw out not more than 1,500 pounds of rock in assorting something like eight tons for the Pioneer mill. . . . An interest in the National and Downey claim has been disposed of to parties in the East for a working capital.

Pahrump—

The *Reveille* of the 9th says: We learned from Mr. S. B. Pike, who arrived here several days since from Pahrump, that work was only slowly progressing there for want of means. He spoke highly of three or four ledges in the district, particularly the Illinois, which he regarded as a fine vein of large dimensions, and exhibiting superior mineral. He brought a number of specimens from different ledges in that section, among which were several from the Santa Rita, a large vein nine feet thick, and well developed through an excavation ten feet deep.

Black Rock—

The Humboldt *Register* of the 4th instant says: A citizen who returned from this mysterious district last week—a close examiner and good judge of mining features—assures us that he believes Black Rock is the richest mineral country in the world. He says sixteen large ox teams are constantly hauling rock to Dull's mill, and that the mill pays as high as \$100 for some of the ores. Ledges of great length, and as wide as you want them.

ARIZONA.

The Reese River *Reveille* of the 10th inst., gives extracts from a Pahrump letter of date August 1st, from which we quote: Parties from San Francisco are building an extensive stone warehouse at Callville, on the banks of the Colorado, in the expectation that the steamers of the Navigation Company will find it profitable to make regular trips from the mouth of the river. There was much talk and excitement among the Mormons about rich gold diggings which had been discovered about seventy-five miles from Callville. It is reported that gold had been brought in by the Indians, and two of the Mormons told me they had been at the diggings. I intend going there with eight or ten men, to make our pile or get bilked, probably the latter.

IDAHO.

The Owyhee *Avantache* of August 4th, has the following items:—Two discoveries of good ledges have been made this week, near the Carrico & Varney, on Florida Mountain. . . . South of Wade's Gulch, a ledge has been struck this week that has every indication of the Poorman. It is on a line with this ledge, and the strikers are elated over the indications. . . . The Richman and Varney & Carrico—of which we spoke last week—are being developed with the most flattering improvements. The Trook & Jennings and South Extension of the Morning Star are inspiring additional confidence. . . . There is a species of placer mining going on in Blue Gulch, rather new to Owyhee—that of deep diggings reached by tunneling. We learn from Daniel Colehower, that he is interested in a claim of this kind at the head of Blue Gulch, and has a tunnel (with branches) in eight hundred feet. Pay dirt is taken out in the Fall and Winter and washed in the Spring.

An editorial in the same paper exclaims against the selling 3-inch seams of quartz to Eastern capitalists for rich veins. It argues, with truth, that the practice has seriously injured the reputation of the Owyhee mines; and adds:—Letters from influential men have been written to New York warning capitalists to not believe the word, oath or representations of any man who is there trying to negotiate the sale of ledges. Why? Because their experience has taught them a costly lesson. We have not heard any one representing eastern interests doubt the existence of many very valuable ledges in Owyhee, in truth enough to make an exceedingly flourishing and permanent mining community.

The *Statesman* has these items:—A new mining camp has been discovered four miles from Mormon Basin, that will no doubt prove to be very rich. A Mr. Glover took out one piece of solid gold weighing 40 10-16 ounces, worth \$640. . . . Good hill diggings have been struck in Boise county, between Boyle's Gulch and Ophir creek, near Placerville. They are reported as paying from 50 cents to \$1 per pan. There is great hope that this species of diggings will prove extensive and revive the flush times of 1863.

The *World* says:—The "French Company," near Pine Grove, took out \$26,000 last week for one week's run. From a 24 hours' run they cleaned up 292 ounces. . . . J. Marion Moore has sold his interests in the Boise Basin for \$45,000, to his partners; and will hereafter give his undivided attention to his Owyhee mines.

MONTANA.

The following items are from the Deer Lodge correspondent of the *Post*, July 28th: Elk Creek has depreciated somewhat in the esti-

mation of a few lately, but chiefly on account of the failure of water.

Benr Gulch presents quite an animated appearance, and a large amount of work is being done in development of that place.

I Henderson and Harvey gulches are proving very good, and quite recently some new discoveries have been made in the vicinity of the former creek. It is said there are now one thousand men at the new diggings. They are reported to pay well, and are very shallow, being only from two to three feet to the bed-rock.

Silver Bow, Butte City, and Oro Fino, are all better camps than ever before, and a large number of men are being employed.

Editorial of same paper says: During the past week, Prof. or Henke of this city (Virginia City), accompanied by Assessor Everts, has spent several days in exploring the mountains west of us. His reports are highly satisfactory. Within a distance of five miles, he found coal, iron, slate, and several quarries of syenite. We have seen specimens of the coal and iron. The coal burns freely, has a brilliant fracture, and when subjected to the blow-pipe, emits a bituminous odor, similar to that of the coal of Western Pennsylvania. The width and extent of the veins it is, as yet, impossible to determine, but we learn, that they have a good cover of slate, and can be worked by drifting with success. The iron ore exhibited to us was equal to any we have ever seen, in weight and purity.

The *Gold Hill News* has seen a Helena letter, from which it quotes as follows: "My impressions of the part of the country are not very favorable; though there are some very rich diggings here; but they are spotted, and too far apart, and water too scarce, for the number of people that are here. . . . There are a good many old Nevadans and Californians here—some few doing well, but the greater part of them doing nothing. . . . Quartz mining in this country, I think will not amount to much; at least, not for some time to come. . . . Nearly all the people from the western slope call this country a—bilk. I heard an old California acquaintance of ours give his idea of this climate, the other day, (and I think his head is level) He says "they have eight months winter, and four months quite late in the fall." . . . I can't advise you or any of my friends to come here."

COLORADO.

The *Denver Gazette* says: Those hopes so generally entertained at the commencement of the season, that we should have really good and lively times in the mountains this summer, have not been realized. Were it not for the furor occasioned by the late discoveries of gulch digging and the prosperous state of the old placer grounds, the present condition of our gold and silver quartz mines would be more severely felt than it is. It would be useless for us to endeavor to inquire into and elaborately state the causes which have brought about these results. Every one at all acquainted with Colorado affairs during the past two years has had them constantly impressed upon him, and the reasons why our mines are not in that flourishing condition which they should and could be, have been perfectly exhausted by the local press, and have long formed a standing topic for the "cognoscenti." For the benefit of the uninitiated, we will compress them briefly into these two causes: "The difficulty of saving the gold from the sulphurets, and the extravagance and useless expenditure of capital by companies formed in the Eastern States." * * As we understand it, Lyon's smelting process only claims to save the gold and silver, and the baser metals, and it is in these baser metals that a great portion of the value of the ores consists. Indeed, the agent from the Swansea Smelting companies sent out to this country to report on its resources, is stated to have given it as his opinion that the copper alone in some of the lodes would pay the expense of transportation to Europe and smelting, and further, that the Gregory lode was one of the richest, if not the richest, copper lode in the world. If this is the case, the future of Colorado, when the railroad shall insure us cheap transportation to the Missouri river, will, indeed, be a brilliant one.

MEXICO.

We condense the following from the *Alta* of 10th inst.: Col. Robinson, who lately arrived from Mexico, has been for the last four months examining the Coarhottite and Rappahog gold mines, and the San Cristobal, Wellington and Central copper mines—all located in the District of Rosario, Sinaloa, Mexico. The Coarhottite and Rappahog have fine quartz mills erected on them, but from bad management of the superintendents who have had control of them, they have not been made to pay dividends. It is true the unsettled condition of the country has to a certain extent prevented the free working of the mines. Nevertheless, by proper management, they can be made to yield largely to their owners. It will require but little capital to start up the mills.

The following is the result of different ship-

ments of copper ore sent to Bremen for reduction, from the San Cristobal copper mine, showing the net profit on each lot of ore from different parts of the mines:

On \$420 lbs., net profit,.....	\$ 136 75
On 77,700 lbs., net profit,.....	1,207 71
On 44,700 lbs., net profit,.....	7,091 76
On 216,500 lbs., net profit,.....	5,936 27
On 23,570 lbs., net profit,.....	422 64
On 2,620 lbs., net profit,.....	401 21

Or about 194 tons, at an average profit of \$47.40 per ton. By manual concentration these ores can be made to yield thirty per cent. of copper metal, and by fire in our smelting, from sixty to ninety per cent. The silver, which is about forty dollars to the ton of ore, will concentrate in proportion in the regulus.

Trades and Manufactures.

WM. BARTLING. HENRY KIMBALL.
BARTLING & KIMBALL,
BOOK BINDERS,
Paper Rulers and Blank Book Manufacturers.
605 Clay street, (southwest cor. Sansome),
15v12-3m SAN FRANCISCO.

JOHN DANIEL,
(SUCCESSOR TO O. GOHL)
MARBLE WORKS,
No. 408 Pine st. bet. Montgomery and Kearny, San Francisco
Monuments, Tombs, Plumbers' Slabs,
Etc., on hand and Manufactured to order.
Goods shipped to all parts of the State. Orders ran-
speciously solicited. 6v8-3m

NATHANIEL GRAY,
General Furnishing Undertaker,
641 Sacramento St., corner of Webb, San Francisco.
Barstow's Metallic Burial Caskets and Cases,
11

THEODORE KALLENBERG,
Maker of Models for Inventors.
MACHINES, MATHEMATICAL, OPTICAL AND PHIL.
OSOPHICAL Instruments, Scales, Weights, etc. Steel
Stamps, Dies and Die Sinking. Engraving Stamps. Repair
ing of machinery promptly attended to.
No. 418 Market street, San Francisco. n7-1f

Palmer's Patent
ARTIFICIAL LEG,
Manufactured in Philadelphia, Penn.
JARVIS JEWETT, AGENT.
629 Washington Street, San Francisco, Cal. 10v8-1m

SAN FRANCISCO MILL.
HOBBS, GILMORE & CO.,
MANUFACTURERS OF
BOXES!
Market street, between Beale and Main,
San Francisco.
For sale, Mahogany, Spanish Cedar, and other Fancy
Woods. 20v12-3m

HUCKS & LAMBERT,
SOLE MANUFACTURERS OF THE CELEBRATED
H. & L.
AXLE GREASE,
Natomia Street and North Beach,
2v13-3m SAN FRANCISCO.

MARSH, PILLSBURY & CO.,
DEALERS IN
Hardware, Tools & Metals,
Northeast cor. Front and Pine street.
4v13-1m

MANUFACTORS AND INVENTORS.

PACIFIC PATENT AGENCY, FOR INTRODUCING
Patents and Patented Articles into practical use, and
to facilitate communication between producer and consumer.
J. H. ATKINSON,
Northeast corner of California and Kearny streets, San
Francisco. 4v13-1m

PACIFIC POTTERY!

STONEWARE AND EARTHENWARE OF ALL DESCRIPTIONS,
such as Butter Pans, Pickle Jars, Churns, Water
Jugs, Bean Pots, Flower Pots, etc., etc., from the Manu-
factory of N. CLARK, Esq., Sacramento—constantly on hand
and for sale, in quantities to suit, by
J. M. PAGE,
20v12-3m No. 42 Clay street, between Drumm and East.

FIRE, HYDRAULIC & SUCTION HOSE,

And Leather Belting.)

M. M. COOK & SON,

801 Battery Street, San Francisco,

Are now manufacturing as above, Fire, Hydraulic and
Suction Hose, and Leather Belting, of any dimension and
in any quantity which may be desired. Fire Hose and
Belting constantly on hand or manufactured to order. Also
Saddles and Horse Collars.
The subscribers would respectfully ask purchasers to call
and examine their stock—also testimonials of the efficiency
of their work from such as have used their hose both for fire
and mining purposes. A diploma was awarded to last
year, by the Mechanics' Institute, of this city, and a silver
medal this year. 12v11-1y

J. F. & H. H. SCHAFER

MANUFACTURERS OF AND DEALERS IN

Bedding and Furniture,

OF EVERY DESCRIPTION,

Blankets, Comforters, Sheets, Etc.,

504 and 506 Sansome street, near Clay,
San Francisco.

This establishment is now generally known to be the
CHEAPEST PLACE in the city for good Bedding. 21v12-3m

Mining and Scientific Press.

W. B. EWER,.....SENIOR EDITOR.

One copy, six months, in advance.....\$3 00
For sale by Carriers and Newsdealers.**Payment in Advance.**—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.**Favorable to Inventors.**—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.**Mr. A. C. Knox,** is our fully authorized Traveling Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.
SAN FRANCISCO, Jan 11th, 1866.**Mr. I. N. Hudson,** is authorized to solicit subscriptions, advertising, etc., for the MINING AND SCIENTIFIC PRESS, in San Francisco, and to receipt for the same.

It is impossible for editors to know all the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

San Francisco:

Saturday Morning, Aug. 18, 1866.

GALE'S NON-EXPLOSIVE GUNPOWDER.

The experiments of the English government for bringing into practical use Gale's method of rendering gunpowder in explosive are still in progress, and the opinion is gaining ground that it will yet be adopted, to a greater or less extent. A large quantity of powder, prepared after Gale's patent, was recently placed in an old isolated government building, the building set on fire and allowed to burn down. Dense volumes of fire and smoke issued from the doors and windows; the only evidence of the presence of the powder was the color and fumes of the smoke—but nothing like an explosion was noticed. Nearly all the members of the Ordnance Committee were present at the experiment, and expressed their entire satisfaction at the result. The powdered glass is very easily prepared, as follows: The most ordinary glass is first heated to whiteness, then thrown into water to render it friable, and subsequently treated in a barrel, very much after the Frieburg process of working ores. But two or three minutes are required to reduce the glass prepared by heating to an almost impalpable fineness. This is mixed with the powder, in the proportion of two parts to one, if it is only meant to render it non-explosive, but still leave it fiercely combustible; in the proportion of three parts to one of common powder, if it is meant to make it incombustible; and in the proportion of four parts to one of the strongest gunpowder to make the latter absolutely harmless. Four parts are, however, generally considered necessary only for the strongest government powder. The method of mixing the two is simply an adaptation of Robinson's cask-cleaning machine, which gives to the cask it holds a rapid double motion, two minutes of which are sufficient to blend the glass-flour and the coarse grains of powder perfectly. It seems that the objection that the bulk of the powder is unnecessarily increased by Mr. Gale's process, is of but little account, for it appears that when gunpowder is stored in the ordinary manner the kegs are but three-fourths filled, in order that the grains may be free to roll, and so prevent their "caking," and a large portion of the glass is also occupied in filling up the interstices between the grains of powder.

Previous to firing the building as above, several experiments were made to fire the powder by electricity, in which some of the kegs of powder actually went out after burning a short time.

A LITTLE boy in Nashville cried himself to death recently over the death of his Newfoundland pet.

THE NATIONAL MINERAL LAND ACT.

NUMBER ONE.

In discussing this subject farther, we will first reply to our correspondent "B. Honest," whose queries were as follows:

1st. Am I right in supposing that a patent, once obtained from the Government for mining claims, protects me from forfeiture of that ground, by abandonment, or by failure to comply with local laws after the patent is received; or in other words, will not, in all probability, a patent for mining grounds give me as absolute and irrevocable title as is conferred by the U. S. Patent for agricultural lands?

Your first supposition is correct. If gained without fraud, your patent renders your title perfect, and as incontrovertible as the confirmation of the Government title to agricultural lands.

2d. Supposing a ledge on a west side hill to run north and south, facing west, and dipping east, and I locate 200 feet on said ledge, and make my north and south boundary lines at right angles with the face or croppings of the ledge, and claim all the dips, angles and spurs, without designating an eastern boundary; will not my location be in conformity with section 2d of the new law, and will not the "lateral dip," which I am allowed to follow by said law, be confined between the north and south lines, drawn at right angles, as mentioned above?

Your location would be in conformity with section 2d, unless there should be local laws (of the district or State) requiring a contrary form of location. The only spur, angle, dip or variation which you would be allowed to follow must certainly be confined between the north and south lines to which you allude.

3d. Is not the writer in the Marysville Appeal laboring under misapprehensions of what is strictly termed "square claims," and would not the boundaries suggested in query 2d, be sufficiently square to accommodate the working of his system of chimneys?

The "square claims" desired by the Marysville correspondent is probably just what we understand the new law provides for. He evidently horrors his trouble from erroneously supposing that the person or corporation owning that section of a lode where a rich seam or chimney crops out on the surface, may have the right to follow the pay streak or chimney in its oblique descent even though it should enter, on the right or left, the location of his neighbor's claim on the same ledge. He cannot possibly be in favor of strictly "square claims," such as were originally made in Nevada County, when the district laws called for lines on all four sides, forming perpendicular boundaries, and giving the owner his ledge only as far as it shall be found directly beneath his surface limits.

By the common method of locating quartz ledges, the notice claims the lode, commencing at a given point, and extending a certain number of feet north along said ledge; together with all its dips, spurs, angles and variations, with ground upon each side of the lode necessary for the purpose of working. This is unquestionably the style of locations held in view by the author of the National bill which has now become a law. Perhaps the following simple diagram will make the matter more plain to the reader who is not versed in vein mining:

1 represents the croppings of a lode running from north to south along the sidehill which slopes from east to west.

N. E. S. and W. show the points of compass; the dotted lines are the boundaries of the claims X, Y and Z.

2, 4 and 6 represent shafts following the lateral dip of the lode eastward, which may be followed into the hill beyond the eastern line

to any depth, "though it may enter the land adjoining."

3 and 5 are chimneys or enlarged streaks of pay ore, extending obliquely down the dip or strike of the lode. The division lines are at right angles with the course or trend of this lode. Chimney 5 commences at the croppings near the mouth of the shaft on company Z's claims, and passes the division line into company Y's ground. Z can only follow chimney 5 as far as Y's line, and Y can work chimney 3 only as far as to X's south line.

We assure our Marysville friend that the lateral dip or vein of a chimney can be followed to any extent desired, but not obliquely to the right or left. We believe that many of these chimneys have an oblique course, frequently occurring with a good degree of regularity. They also abound with large pockets and chambers, strung along their oblique course not unlike a string of beads. The uniformity of their occurrence is worthy the attention of careful and observant miners.

We find the discussion of this law a lengthy subject, and shall continue it from week to week. We are skeptical of its value to the Government or the prosperity of mine working.

LOOK TO THE WATER IN YOUR BOILERS.

Too great care cannot be observed by mill owners and engineers, especially in new mining locations, in carefully examining the water which they propose to introduce into their boilers for making steam. Boilers are very soon eaten away by some waters, often leading to disastrous explosions, but more frequently causing a rapid deterioration of the boiler, which soon involves the cost of a new one. Water from mines where copper pyrites are present, even in small quantities, usually contains more or less sulphate of copper, in solution, which always causes no little corrosion of the boiler plates, and is attended with a deposition of spongy metallic copper. All who are acquainted with the usual wet process of assaying copper must be especially aware of this action. Mine waters are rarely entirely free from saline or acidulous constituents, such as will produce more or less corrosion upon boilers. Soft waters, from the surface, also often carry a considerable amount of organic matter, free alkali or carbonic acid in solution, which produces a degree of corrosive action. The perishable nature of iron, when in alternate contact with water and air, used in any condition, is well known to every one; and no engineer should fail to keep a watchful eye upon both the never ceasing deterioration of his boiler and the kind of water used for making steam. A careful analysis of the usual supply of water, from time to time, could scarcely fail to be of use in guiding the engineer to the proper corrective agents for rendering the water employed as harmless as possible. Hard water containing bi-carbonate of lime may be readily precipitated, throwing down the lime as neutral carbonate, leaving a clear water, which will no longer form an incrustation when boiled, thereby leading to a rapid burning out of the boiler. Soft waters acting corrosively when boiled may be corrected by the addition of a little lime, and acidulous waters may be as easily corrected by the addition of alkali. An analysis of any water which acts corrosively on boilers, will almost always enable the chemist to point out some simple method of correcting the evil at a merely nominal expense.

TERRIBLE CATASTROPHE.—Yesterday morning, between two and three o'clock, the Summer-street House, a well-known lodging house, located on Summer street, between Montgomery and Kearny streets, and near California, fell with a terrible crash, burying beneath its ruins upwards of twenty-five of the inmates, eight of whom were killed, seventeen seriously and several others slightly wounded. The fire-alarm bells were immediately rung, and the Department called out to assist in clearing away the ruins, and saving such as might have escaped instant death. The cause of this terrible catastrophe was the undermining of the wall by parties engaged in putting up a new building by its side. The location is within three or four hundred feet of the former terrible nitro-glycerine disaster, upon the premises of Wells, Fargo & Co.

THE ATLANTIC CABLE A SUCCESS.

It is now twenty-two days since the eastern end of the Atlantic Cable was landed at New Foundland, a time quite sufficient to justify the opinion that the project is a complete success, as a mechanical and scientific undertaking. With regard to its pecuniary success, there can be no doubt when we reflect upon the amount of work it is capable of performing. On the 28th of July 4,000 words were transmitted through it in twelve hours; which, at the established price of \$5 per word, would be \$40,000 for a day of twenty-four hours. This is what the cable is capable of doing. The vast and rapidly increasing importance to the commercial world, of hourly communication with all the great centers of business, is a sufficient guarantee that no one line will be able to do the work that will soon be attracted to the offices of the company. That the parties having the greatest pecuniary interest in this enterprise are fully of this opinion, is sufficiently shown by the expedition which is now at sea for the purpose of fishing up the end of the lost cable, with the view of splicing on and completing a second line across the ocean.

The mining as well as the commercial world has a deep interest in this great enterprise. Speaking of its value to the mining interest, the American Journal of Mining, of New York, when in hourly expectation of the arrival of the wire on this continent, very properly remarked as follows: "Telegrams flashed backward and forward between the two continents must necessarily tend to equalize rates in the great mining and metal markets of the world. The San Francisco stock market is influenced by the working condition of the Comstock mine—as telegraphed hourly to that city from Virginia; the New York market, so far as Nevada stocks are concerned, is influenced by that of San Francisco; and the London market is similarly affected. But in London, at present, there are intervals of days without hearing of change in prices of stocks, and during those days violent fluctuations may have occurred. The telegram is the great equalizer, whether as to mining stocks or metal or any other sales. If telegraph wires connect every great center of trade in the world, then we believe prices everywhere (save the differences in tariff) must be more equal. The Atlantic is the only difficulty in the way of reaching all these centers, and therefore, as the public should be anxious to gain its benefits, they should show some sort of interest in the progress of the endeavor to secure them."

The attempt which has just proved such a signal success, is the fifth which has been made. The first in 1857, failed by the cable being broken when 300 miles from the starting point; the second in 1858 failed in consequence of a storm soon after the expedition got out; the third, also in 1858, succeeded for a time, and was the cause of great rejoicing, but for some unknown reason soon gave out; the fourth, in 1865, parted in mid-ocean; the fifth can now be safely pronounced a complete success.

Twelve years of arduous, anxious toil, of patient solicitation and of stubborn adherence to an idea, which nearly all the world pronounced chimerical, have now been rewarded by one of the most glorious triumphs of science and genius which the world has ever witnessed, and which has rendered the name of Cyrus W. Field immortal. The idea of the Atlantic Cable is essentially American, although British capitalists and the British Government are entitled to the chief credit of carrying it out. The failure in the earlier attempts were well improved in perfecting the manufacture and arrangements for laying the last cable. The Journal of Mining, of July 21st, give illustrative representations, descriptive of the different modes of constructing the several cables. The description of these illustrations shows very conclusively the superiority of the present cable over those which have preceded it. It is stronger, lighter and more flexible than either of its predecessors, and we trust it will withstand for a long time the action of the elements, and the strain of work which may be put upon it.

CUPRIFEROUS LIGNITES & BRUSHITE.

Vegetable remains, partially converted into copper, or accompanied by the sulphurets of that metal, are often met with in various parts of the world. These remains are usually termed "cupriferous lignites." In Pennsylvania, beds of vegetable stems, impregnated with vitreous copper and green carbonate of copper, occur in the shale at the base of the Devonian series. In several instances these "indications" have been worked as copper mines; but either the quality or quantity of ore does not seem to admit of their being made profitable. The mineral often occurs in the form of a gray sulphuret.

In the State of New York, cupriferous lignites occur under similar circumstances, in the Catskill Mountain series. They there often consist of vegetable casts, replaced by the sulphuret or carbonate of copper. In the provinces of New Brunswick and Nova Scotia, cupriferous lignites occur in the coal measures, and consist of ferns and other coal plants, impregnated with vitreous copper ore, and coated with green carbonate. These vegetable remains are converted partly into copper ore, and partly into coal. An attempt has been made to work such a deposit at one locality; but the irregular distribution of these organic remains rendered the undertaking unprofitable. Cupriferous beds of a similar character have been noticed in Russia, where the fossil stems and leaves present indications of copper in the form of oxides and carbonates, distributed through and around them. The same is seen in the Tyrol, and in portions of Germany. In the Spanish Pyrennes, a seam of this character of mineral occurs, eighteen inches thick, and cropping out quite extensively. In 1842-3, this seam was worked as a copper mine, it is said, with profitable returns.

The occurrence of this mineral, under these peculiar conditions, is certainly very remarkable, and is doubtless due to causes similar to those which have produced

THE NEW MINERAL, BRUSHITE.

The discoverer of this new mineral was Mr. W. E. Brown. It was found in gnauo from an island in the Caribbean sea. Its discovery was first communicated to the scientific world about a year and a half ago, by Mr. C. E. Moore, who sent an account of it to Silliman's *Journal of Science*, and therein named it *Brushite*, after the eminent Professor Brush, of Yale College. The mineral is found in the gnauo, in seams or veins, varying from one-eighth to one-fourth of an inch in thickness. It occurs in the form of small but very perfect crystals, of a yellowish white color. When heated in a close tube, before the blow-pipe, it whitens, and at an incipient white heat gives off its water of crystallization. Chemical analysis revealed the presence of lime, phosphoric acid and water, with traces of magnesia and alumina. In the polarizing microscope it showed a vivid succession of colors. We presume that neither the friends of the plutonic or infiltration theories will claim any of the particular minerals alluded to in this article, as having been derived from either of their systems of the origin of mineral veins.

GREEN EMIGRANT, PLACER CO.—Very rich quartz was found in that claim about eighteen months since, and for a time there was much excitement consequent upon the discovery. The drawback, however, was the absence of any well defined ledge. Much work has since been done in the sinking of shafts and drifting from the same, but with unsatisfactory results until last Tuesday, when a drift run forty feet from the bottom of a shaft, about thirty-five feet deep, struck a ledge twenty inches in width, that shows handsomely in free gold.—*Herald*, August 11th.

FAZEN KINDNESS.—The world is full of kindness that never was spoken, and that is not much better than no kindness at all. The fuel of the stove makes the room warm, but there are great piles of fallen trees lying among rocks on the top of the hill, where nobody can get them; these do not make anybody warm. You might freeze to death for want of wood in plain sight of all these trees, if you had no means of getting the wood home and making a fire with it. Just so in a family, love is what makes the parents and children, the brothers and sisters, happy; but if they take care never to say a word about it; if they keep it a profound secret, as if it were a crime, they will not be much happier than if there was not any love among them; the home will seem cold even in summer, and if you live there you will carry the dog when any one calls him "poor fellow."

A BUTTER WORKING MACHINE.

We have long had the aid of machinery for churning the cream in the first process of butter-making; and more recently an ingenious Yankee has given us a "cow-milker," by the aid of which one man can do as much milking as three in the ordinary manner, and do it better, too. It is now announced that an Englishman has invented a machine for separating the buttermilk from the butter, after churning. This slow and laborious process has hitherto been done altogether by hand, and generally very poorly done, as every person in the community can fully testify.

This machine for removing the buttermilk, consists of a hollow metallic cylinder, properly secured and suspended over a bowl of water. One end or head of the cylinder consists of a movable plate, working very much like the plunger in a pump. The opposite head of the cylinder is perforated with a great number of very small holes. After the butter has been placed in the cylinder, a powerful pressure, hydraulic or otherwise, is brought to bear on the movable cylinder-head, which advances gradually to the opposite end of the cylinder forcing, in its progress, the butter through the holes in the stationary head, in the form of very fine vermicelli. By this means the buttermilk is said to be completely excluded from the butter, which is of course left in a condition much sweeter and closer than it is possible to attain by any mere hand process.

It this machine will accomplish what is claimed for it—and we see no reason why it may not—it is of more commercial consequence than would appear at first glance. The great difficulty in making good butter, is to get entirely rid of the buttermilk. All who have had any experience in that part of dairy work, are aware of the almost impossible task of accomplishing that work; and as it has heretofore been exclusively a severe and tedious hand labor, the temptation has been very great to slight it. The consequence is, that our tables are almost universally supplied with a most execrable apology for butter, instead of the sweet, delicious and fragrant substance which constitutes that article in its purity.

Now, if our English cousin has really invented a machine which will give us good butter all the time, he has accomplished a work for which all christendom will thank him thrice a day. Then, as to its commercial value. It forms the last link in the chain of invention which brings almost the entire process of butter-making within the domain of "machine-work." After the cow is milked, which, as we have already said, may now be done by machinery, any horse or mule power, with a little attention, will do all the rest of the work, and with the facility and perfection which is always due to machine work. Instead of depending on hundreds of little dairies, every one of which has its own quality of butter, and the aggregate of which is a horrible compound; the milk will be collected at convenient centers, as it is for cheese-making, or for table use, where it can be churned and "worked" by machinery, and where the work will be cheaply, uniformly and well done. The result of the whole will be a cheaper and better character of one of the most common and indispensable articles of daily table use.

Address to the Voters of San Francisco

We, the members of the Democratic County Convention, respectfully addressing ourselves to the Voters of San Francisco, claim for the ticket we have nominated your approval and support.

We have succeeded in securing gentlemen of irreproachable character and acknowledged fitness to serve as candidates. In making the selection, we have been careful that schemes for personal aggrandizement and mere political success should not shut out from view the future welfare of the community. The peace of the city, protection to property, and fidelity on the part of the custodians and dispensers of the public moneys, are the considerations which have controlled our deliberations.

We are persuaded that a change for the better can be made in the manner of administering the several Departments of the City Government; and this we believe to be the general conclusion in the public mind.

Whilst it is conceded that much credit was due, for a time, to those who managed our municipal affairs in an independent spirit, it is also contended that more recently they have ignored the former proper tests for official position, and have become mere partisans, intolerant in their views and prejudiced in their action. With this change in the spirit of their government, there has also come extravagance in public expenditures, oppression in their license system, and corruption in the police regulations. Reform is therefore needed in the City Government. This reform can be effected only through the agency of the ballot box. To that end we heartily invite the co-operation of the voters of San Francisco.

Nor should it be forgotten that the result of the approaching election will, to some extent, affect all the social and monetary interests of our city. Moreover, it will exert an important influence on politics throughout the State; and in order that the people may fully appreciate the political significance of the victory we fervently hope to achieve, we shall briefly declare the principles which our nominees adhere to, touching their duties and the great issues of the day.

We pledge them to a faithful discharge of the obligation their election will cast upon them.

We pledge them to an unwavering support of those principles of our Government which assert the supremacy and vindicate the dignity of the white race.

We pledge them to the doctrine of the equality of all of the States of the American Union, and the right of each individual one to determine, under the Constitution of the United States, the qualification of its electors, and to provide for its local prosperity and domestic happiness in its own way; and

We pledge them to a firm adherence to the policy of the National Administration, looking to the defense of these great principles as the only means calculated to heal our differences, to secure for the Government the undivided affection of the people, and to the Union of the States that freedom, prestige and power rightfully belonging to a great Republic; and, in conclusion,

We declare that they approve of the call for a National Convention, and hope that beneficial results may come of its patriotic purpose.

Finally, we beg leave to say that the evasion practiced by the County Convention of the opposite party on these vital questions, is, in our opinion, designed to accomplish a great political fraud; and is trifling with the intelligence of the people and the interests of the State. We condemn as dangerous, ill timed, and characteristic of Radicalism, the letter and spirit of the address put forth by that body. It is but an appeal to the passions of party at a time when those powerful in war and successful in battle should be just and magnanimous in peace.

VOLUME THIRTEEN

—OF THE—

Mining and Scientific Press,

COMMENCING JULY, 1866.

DEWEY & CO., Publishers.

Issued every SATURDAY, at our Book and Job Printing Office, 505 Clay street, corner of Sansome, SAN FRANCISCO.

Terms in Advance—One year, \$5; Six months, \$3; Single copies, 15 cents; Monthly Series, \$5.50 per year, or 65 cents per number. Back Volumes from January, 1864, \$3 per volume; bound, \$5 per volume.

THE MINING AND SCIENTIFIC PRESS is now thoroughly established, and enjoys one of the largest and most permanent subscription lists of any weekly journal on this coast. The individual character and reputation of its constant patrons throughout the entire coast is one of the best recommendations of its merits and value as a medium of intelligent progress and prosperity.

DEWEY & CO., Proprietors.

Mining and Scientific Press Patent Agency, Newspaper Book and Job Printing Office, 505 Clay street, San Francisco.

C. W. M. SMITH. W. B. EWER. A. T. DEWEY.

SEND US WORD.—If any subscriber to this journal fails to receive the same regularly and promptly, they will con for a favor by informing us at once.

TOWN SCHOOL HOUSES.—God in the country is generous to children. They have all outdoors except the grain field and the tall grass. But in the city, has there been any city provision for their wants? If none has been made for them, then the children must become either trespassers or sufferers. This then, is the reason why every city school-house ought to have a large lot around it. A city boy's farm—where he can carry on with a clear conscience.

THE SPANISH INQUISITION.—The so-called "Holy" Inquisition, at Seville, caused 2,000 heretics to be burned, and 16,000 to be condemned to punishments, which entailed moral degradation and confiscation of property. According to Llorente, the Inquisition, from its origin to its abolition in 1808, caused 31,912 Spaniards to be burnt alive, and condemned 291,450 persons, thus ruining upward of 340,000 persons, whose shame was visited upon their families, for whom naught remained but disgrace and misery.

THE TREE TOAD.—We often hear the croak of the tree-toad, but we do not often see the little animal, for the reason that, like some kinds of lizards, it has the faculty of taking very nearly the color of the limb or bark to which it clings. And when anybody is near, the little fellow is apt to keep quiet, so that his place may not be discovered by his noise. By careful search, however, he may be discovered, keeping a very sharp look-out and a very tight mouth.

KINDLINESS.—The last, best fruit which comes to late perfection, even in the kindest soul, is tenderness toward the hard, forbearance toward the unforbearing, warmth of heart toward the cold, philanthropy toward the misanthropic, charity to all.

PATIENCE is genius; greatness the fruit of indefatigable labor; and success in life the result of purpose and persistent industry.

J. B. CONE, BUSINESS AGENCY.—Makes private sales of Property and Business Places of every description, in the city and throughout the State; procures partners with large and small amounts of money; negotiates sales of mining property, and does a General Agency Business. Patronage solicited by mail, express, or by personal application at the office, 402 Montgomery Street, San Francisco, California. 23v111f

Machinists and Foundries.

PALMER, KNOX & CO.,
Golden State Iron Works,
Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF
MACHINERY,
STEAM ENGINES AND QUARTZ MILLS
DUNBAR'S IMPROVED
Self-Adjusting Piston Packing.
Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.
WHEELER & RANDALL'S
NEW GRINDER AND AMALGAMATOR
HEPBURN & PETERSON'S
AMALGAMATOR AND SEPARATOR,
Tyler's Improved Water Wheel,
Giving the greatest power, at lower cost, than any Wheel in use. There are over 1,500 running, giving universal satisfaction.
KNOX'S AMALGAMATORS,
WITH PALMER'S PATENT STEAM CHEST,
Superior for working either Gold or Silver Ores.
Genuine White Iron Stamp Shoes and Dies
Having been engaged for the past eight years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-1f

M. GREENBERG. **W. H. MOORE.**
GREENBERG & MOORE,
Eagle Brass Foundry,
No. 43 First street, San Francisco,
(Between Mission and Market.)

MANUFACTURERS OF
all kinds of **BRASS** and
Bell Castings; Force
and Lift Pumps; Cocks
and Valves of every de-
scription made and re-
paired; Oil Globes, Steam
Whistles, Hydraulic Pipe
and Nozzles (for Mining
purposes). Also,
COUPLINGS OF ALL
SIZES.
Particular attention paid to Hydraulic Pipes and
Nozzles; also, to Ship Work of all descriptions. All orders
from the interior will be attended to with promptness and
dispatch. 23v123m

LEWIS COFFEY. **J. S. JASON**
LEWIS COFFEY & RISDON,
Steam Boiler & Sheet Iron Works.

The only exclusively Boiler Making establishment on the
Pacific Coast owned and conducted by Practical Boiler
Makers. All orders for New Work and the repairing of Old
Work, executed as ordered, and warranted as to quality.
Old Stand, corner of Bush and Market streets, opposite
Oriental Hotel, San Francisco. 24v12y-1y

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Works, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rice, Screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.
ENGINES. Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.
BOILERS. Locomotive, Flue, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.
PUMPS. The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's Improved Tractory Curve Pan, Zenas Wheeler's Improved flat bottom pan, Beldin's pan, Veatch's tubs, Prater's concentrators, Waklee's pans, Beers' pan, Oerman Barrels, Arastra Gearing, Chilo Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS,** of all sizes.
OIL BORING TOOLS AND MACHINERY.—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.
Russia Iron Screens, of all degrees of fineness and of all qualities of Iron. All work done in the best manner at the lowest cash prices.
H. J. BOOTH. **GEO. W. PRESCOTT.** **IRVING M. SCOTT.**
24v12 **H. J. BOOTH & CO.**

Vulcan Iron Works Company

(ESTABLISHED 1850.)
First, Natoma and Fremont Streets.

IRON FOUNDERS,
Steam Engine and Locomotive BUILDERS.

Boiler Makers, and Workers in Sheet Iron, Brass and Copper.

These Works have lately been increased by the addition of new shops on Fremont Street, doubling the capacity of the original establishment. Their facilities for turning out machinery promptly and efficiently, are now unequalled in the State. Their Boiler Works have also been enlarged correspondingly.

The Company are prepared to execute orders for all classes of Machinery and Boiler Work, such as:

Minag, Steamship, and Steamboat Machinery,
Railroad Machinery, Locomotives, Car Trucks, Car Wheels, Housings and Irons; and
Manufacturing Machinery of Every Kind.

Sole Manufacturers of

HEPBURN & PETERSON'S REDUINO PAN AND AMALGAMATOR
BEATH'S AMALGAMATOR;
HESS & MOORE'S IMPROVED HOWELL QUARTZ CRUSHER;
BAUGH & GUIDO'S AMALGAMATOR AND SEPARATOR;
FAUCHER'S QUARTZ GRINDER AND WATER WHEEL;
JONVAL'S IMPROVED WATER WHEEL;
LEFFELS' AMERICAN DOUBLE TURBINE WATER
STEVEN'S PISTON PACKING RINGS.

They have also a large assortment of Patterns for Pumping and Hoisting Machinery, Gearing, Pulleys, Water Mill Irons, Hydraulic and Screw Presses, Retorts, Furnaces, Grate Bars, House Fronts, Ornamental Fence Posts and Paving, Stove Ranges, etc., etc.

Quartz Stampers, Shoes and Dies, of the best Hard Iron. Quartz Screens of Russia Iron Punched to Order. 27

GEORGE T. PRACY,
MACHINE WORKS,

Nos 109 and 111 Fremont street, near corner of Mission,
OPPOSITE MECHANICS' HILL,
SAN FRANCISCO.

STEAM ENGINE, FLOUR AND SAW MILL
And Quartz Machinery, Printing Presses,
—AND—
MACHINERY OF EVERY DESCRIPTION MADE AND REPAIRED.
Special attention paid to Repairing. 23v12y-3

Pacific Forge Company.

FORGING AND IRON WORK.

THE PACIFIC FORGE COMPANY HAVE JUST RE-ECTED, in this city, on Fourteenth street, near the machine shop of the San Jose Railroad, a large establishment for the purpose of forging and working in wrought iron. Our hammer is the largest upon this coast, and we are prepared to manufacture, at short notice, all kinds of heavy forgings, ear axles, shafts, steamboat cranks, piston-rods, wagon axles, and other similar work. This is the first general shop of the kind erected in this State, and we solicit the patronage of the public. All orders executed at reasonable rates, and with promptness and satisfaction. 19v123m

J. F. FLYNN. **HENRY FRANCE.**
FLYNN & FRANCE,
EMPIRE FOUNDRY,

221 Mission street, below Beale, San Francisco, PRACTI-
CAL IRON FOUNDRIES, having unequalled facilities for
the manufacture of **LIGHT FAVOR CASTINGS,** particular at-
tention will be given to this department. We manufacture
School Seats and Desks, Agricultural Implements, Railing,
Ship Castings, State Irons, and all other kinds of Heavy and
Light Castings, with dispatch. The patronage of the public
is respectfully solicited. 24v12y-1y

HANSCOM & CO., (T. PRINDERGAST,
H. S. SMITH.) (W. W. HANSCOM.)

Etna Iron Works!

Southeast corner Fremont and Tehama streets,
SAN FRANCISCO.

Practical Machinists and Iron Founders,
MANUFACTURE

STEAM ENGINES,
QUARTZ MILL MACHINERY OF ALL KINDS,
SAW MILLS, FLOUR MILLS,
Dunbar's Improved Self-Adjusting
PISTON PACKING,

Now so extensively used in the East and in this State. Re-
quires no springs or screws; is always steam-tight; without
excessive friction, and never gets slack or leaky.

HANSCOM'S CRUSHER,
The best of the kind now in use in this State or anywhere else
Wheeler & Randall's New Grinder and
Amalgamator,

Which only needs examination to be appreciated.
Tyler's Improved Water Wheel,
Giving greater power, at lower cost, than any wheel in use
Send for one of our circulars, giving full tables.

All Wheels warranted to give the power as set forth, or
the money will be refunded.

Sole makers for this coast of the "Pendergast
White Iron Stamp Shoes, and Dies.

None genuine unless obtained from us. Every one war-
ranted.

Patented Machinery of all kinds will be furnished by us
at market prices. Particular attention given to drawings
and specifications of machinery, which will be made to
order. The patronage of the public is respectfully solicited.

Francisco for the last fourteen years, and enjoys the repu-
tation of having built ONE HUNDRED AND SEVENTEEN
STEAM ENGINES.

Screw Propellers of all kinds, and Steam Boat Machinery
generally, made to order, and warranted to give perfect
satisfaction in every particular. 24v123m

[Written for the Mining and Scientific Press.]

From the Humboldt Oil Regions.

EDITORS PRESS:—Concerning oil matters I have gathered the following items, by walking sixteen miles, last Sunday, crossing the North Fork of the Mattole thirty times, in water averaging knee-deep:

The Union has resumed work, and on the 14th was 220 feet deep, with usual "indications," but little oil.

The North Fork company are running out their shaft, and have piped 260 feet. The greatest depth attained being 275 feet, at which point the caving began, compelling them to insert pipe from the surface down. Small quantities of oil are obtained each morning from the sand pump.

The Davis well is down 1,040 feet, with not the slightest indications of oil. One of the company has gone to San Francisco to ascertain whether to continue on the claim, or cease drilling. This well is worked by an 8-horse steam engine.

The Jeffrey company are down 660 feet, with no better indication than when you were last advised. This is worked by steam also—6-horse power. Their average is ten feet daily, worked by two men at an average expense of \$300 per month, which they pay promptly, as also does the Davis.

The Allen and Sutter has been attached for the sum of \$111.87.

H. Boyington, who was in charge of the premises, has disposed of what "grub" was on hand, and departed for New River mines, much to the regret of your correspondent. A recent decision of the Land Office has virtually given the title to the land on which their works are located to the McNutt heirs. Thus, one by one, they pass away. Why is it? Simply because a well cannot be sunk 500 feet without a cash capital, at the lowest estimate, of \$7,000 when the work begins. Then the company should pay their employees regularly, and not contract a debt of any nature while the work progresses. Finely engraved certificates of stock will not accomplish the aim, and companies that rely on such for their capital must fail. Foreseeing the result, your correspondent directed his attention to "settling land titles" by *stealing* (squatting on) 160 acres of land, and a cabin. Having several acres of vegetables thriving nicely thereon, he is prepared to "see it out."

The land in this vicinity has at least three claimants. First, the U. S. Government. Second, Col. Wm. Muldrow, claiming all from Cape Mendocino to Point Reyes, some 2,600,000 acres, deriving his claim from the Russian Government, through General Sutter, to whom he says he paid \$60,000 for the deed. Third, "Bulkhead" Persons has covered thousands of acres consecutive with School Warrants and Indiana War Scrip.

Your correspondent, desirous of settling the titles for all interested, holds the quarter section above mentioned—enough, as it stands, to keep the wolves from the door this summer.

Dex.

P. S.—Noble, of Joell Flint company, is expected out on the "next steamer," to resume work at that well.

D.

Petrolia, July 15th, 1866.

[The above communication was a long time on the way to this office.]

A CHILD'S FUNERAL IN MEXICO.—In Mexico and other Spanish-American countries, as also in some parts of Europe, the funerals of children are celebrated with music and the firing of rockets, and with signs of rejoicing rather than of sorrow. The procession is often preceded by a man playing a lively air on a violin. For it is believed literally, as said by Christ of little children, "Of such is the kingdom of heaven," and that to die young secures salvation, as well as escape from the toils and troubles of life. The corpse of the child is covered with flowers, and its little pale cheeks often pointed in imitation of life.

CHINESE WALL.—The most extensive *manu-* structure is undoubtedly the great Chinese wall. It is 24 feet high, and 10 feet wide, and reaches to the extent of from 2,000 to 2,400 miles, over mountains, precipices, and rivers, up to the sea on one side, and the inaccessible mountains of Tibet on the other. The Chinese truly call it one of their wonders of the world—as the stones used for its construction, if placed one beside the other, would suffice to encompass the whole circumference of the globe. The entire history of this construction is wrapped in similar obscurity with that of the Pyramids of Egypt.

DETraction proceeds from envy, and is always pointed at those whom we conceive to be our superiors.

THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequalled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully solicited.

GODDARD & COMPANY.

International Hotel,

JACKSON STREET, BETWEEN MONTGOMERY AND KEARNY STS., SAN FRANCISCO, CAL.

THIS OLD ESTABLISHED HOUSE IS IN PERFECT order for the accommodation of guests. Persons seeking comfort and economy will find this the best hotel in the city to stop at. The beds are new and in good order, and the Rooms well ventilated. The Table will always be supplied with the best in the market.

Prices, varying from \$1.50 to \$2 per day for Board and Room.

FINE BATH HOUSE AND BARBER SHOP ATTACHED TO THE HOUSE.

Terms belonging to the House will be in attendance at all the boats and cars to convey passengers to the House FREE OF CHARGE, and to any part of the city for 50 cents. 24112 P. E. WEGANT, Proprietor.

INTERNATIONAL HOTEL.

K Street, between Third and Fourth, SACRAMENTO.

IS NOW ONE OF THE LARGEST AND MOST ELEGANT Houses in Sacramento. It has seventy-five Rooms, which can be had in suites for families, or singly to suit individuals—all new-furnished, large and finely ventilated. No expense has been saved to make it comfortable and pleasant for guests. Price of Rooms very low. Meals, 25 cents. 84123m B. EISENMEYER.

WHAT CHEER HOUSE, SACRAMENTO.

Fire-Proof Brick Building, corner Front and K Streets, opposite Steamboat Landing.

Meals, 25 cents. Board, per week, \$1.00. Board and Lodging, per day, 1.00. Single Rooms, 50. Railroad Ticket Office and Stage Office on first floor. 74123m A. J. SENATZ, Proprietor.

Rheumatism!!

READ IT! READ IT!!

SACRAMENTO, April 16th, 1866. H. BOWMAN—DEAR SIR: THIS IS THE FIRST WRIT- ing I have done in two years, and it affords me great pleasure to be able to use my pen in the service of those who are suffering, as I have suffered, by stating the following facts:

I have for two years and upwards been afflicted with CHRONIC RHEUMATISM, and until a few weeks ago I have never found anything that afforded me any relief. For three months of the time I was unable to walk, and for the last five months my arms have been so bent that I have not been able to dress myself. I was five months at the Warm Springs, at San Luis Obispo, and three months at a Hydropathic Institute in Stockton, and I have been under the care of six different physicians, in the vain hope of relief. About four weeks ago I was induced by a person who had been cured by it to try a bottle of RICHARD'S REMEDY FOR RHEUMATISM, and in less than twelve hours I experienced great relief. In a few days I was enabled to straighten out my arms, and I have been getting better and gaining in strength and flesh ever since. I have now the complete use of all my limbs, and, for the first time in two years, I am out of pain. I do feel for those who suffer as I have suffered, and if they will take my advice, they will lose no time in giving the REMEDY a trial. Yours truly, GEORGE TAYLOR.

53 RICHARD'S REMEDY is for sale by

H. BOWMAN, Druggist, Sacramento. 24112

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are among the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. The Mining and Scientific Press PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

Capitalists, Attention!

QUARTZ MILL & MINING PROPERTY FOR SALE

In Nevada County.

A NEW 8-STAMP QUARTZ MILL, 7 LEDGES AND 640 acres heavily timbered Land, near Eureka, Nevada County, are now offered for sale. The Mill is run by steam power, and is in complete order for business. The ledges, which form the principal value of this property, are all large and well-dipped, but require a further outlay of capital, in order to make them remunerative. For the lack of means to properly develop these claims, the present owners are disposed to sell the same for a reasonable price.

Capitalists wishing to engage in mining will find this a splendid opportunity to purchase a property that will bear right scrutiny, and offers superior inducements as an investment.

For address and further information, inquire of the Publishers of the MINING AND SCIENTIFIC PRESS, 605 Clay Street, San Francisco. 22112

HAYWARD, COLEMAN & CO.,

IMPORTERS AND REFINERS

Illuminating, Lubricating, PAINT OILS!

CONSISTING OF

KEROSENE, LARD, SPERM, ELEPHANT, POLAR, TANNERS', NEATFOOT, BOILED AND RAW LINSEED, CASTOR AND CHINA NUT.

—ALSO,—

SPIRITS OF TURPENTINE & ALCOHOL

NOTE.—We would specially call the attention of Mill owners and Engineers to our superior PARAFFINE OIL, which we manufacture from the California Petroleum. This Oil will not gum. Machinery thoroughly cleaned and lubricated with it will not heat, and after remaining at rest, can be started without cleaning off.

53 A sample can of our Paraffine Oil will be forwarded on application to us, as we desire a fair and impartial trial.

Lamps and Lamp Stock!

53 An elegant and complete assortment on hand. 4113-3m19 414 Front street, San Francisco.

THE CALIFORNIA

Aerated or Unfermented BREAD COMPANY.

Bakery on Folsom Street,

Between Tenth and Eleventh.....SAN FRANCISCO.

MESSRS. TAGGART, BULKLEY & DUFF, HAVING associated themselves in copartnership, are happy in announcing to the public that they are now prepared, and would respectfully solicit all orders for his truly wholesome and cleanly Bread. We have a sufficient number of delivery wagons at our bakery to guarantee to all who may favor us with their patronage a prompt delivery of fresh bread daily, Sundays excepted.

Through the kindness of the gentlemen of the following named firms, we are privileged to keep an order box for the entry of all orders for the bakery so that they may reach our earliest attention:

Order box at C. J. Hawley & Co's Grocery, corner Second and Jessie streets; Rowland & Walker 617 Clay street; Plum's Carpet Store, Montgomery street, opposite Leek House; G. W. Clark, Paper Hanging, corner Sansome and Clay streets. Orders handed to any of the above men like-wise. We expect soon to be prepared to supply Pastry, likewise the Boston Brown Bread, and Beans of the first quality. Due notice will be given.

The present Company is entirely independent of the former California Unfermented Bread Company, neither of them having been in any way connected with that company.

We would cordially invite the public to make a visit to our new bakery. 4113-3m S. R. BULKLEY, Business Partner.

—AND—

METALLURGICAL WORKS,

Practical Mining School,

Bryant Street, Between Third and Fourth, SAN FRANCISCO.

THE PROPRIETORS are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphurets, pyrites, and the (so-called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having then all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; a, Dies; c, Shoes, and o, Openings.

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan when properly constructed, are respectively 177, 118 and 132. That is, the respective millers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan one hundred and eighteen tons, and the Conical Pan one hundred and thirty-two tons to the same degree of fineness in the same time. The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be. Another property of excellence in this machine is that the metal or substance to be amalgamated passes direct from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burnt. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior." As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE Union Iron Works and Golden State Iron Works, WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

Machinery. VARNEY'S PATENT AMALGAMATOR. These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows: The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated. Setters made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed. Mill men are invited to examine these pans and settlers for themselves, at the PACIFIC FOUNDRY, San Francisco.

LEFFEL'S American Double Turbine

THIS WHEEL, WHICH HAS HAD THE most unprecedented sale of any water-wheel ever made, and which has given unusual satisfaction whenever used, is now for sale by KNAPP & GRANT, 310 Washington street, San Francisco, where persons desiring to use water-power can be supplied. These Wheels are adapted to use from 10 to 5,000 inches of water, and from 4 feet to 500 feet fall. Let us know how much water you have either in mill-race or cubic feet per minute, what fall you have, and what power you require. Write or send for circular to KNAPP & GRANT, San Francisco.

Leffel's Lever Jacks, For railroads, cars, or wagons; Railroad Jacks for engines and cars; Track Jacks for leveling, with which three men, with a pair of these Jacks, can level more track in a day than twelve men working in the ordinary manner; also, Track Jacks, for relieving the axle of pressure to replace the brass. These Jacks are now in general use in the Eastern States, and give entire satisfaction. Also, Wagon and Track Jacks of the most superior make and kind. For sale by 12 1/2-3m KNAPP & GRANT, San Francisco.

The Hansbrow Pumps ARE WARRANTED THE BEST.

FIFTEEN KINDS AND SIZES, Adapted for FARM, Mill and Mining Purposes. Fitted for HAND, WIND, HORSE, WATER AND STEAM POWER. For sale in every city and town on the Pacific Coast. LOCKE & MONTAGUE, Agents, 112 and 114 Battery Street, San Francisco. Send for Illustrated Catalogue. 3v12-2m

BAUX & GUIOD'S Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgamators now in use, and to re-work their old tailings. The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance. Its small cost; its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus. We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jeffersonian Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crall's Gravel Cement Works, Nevada county; Wattman's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works and San Francisco Foundry, San Francisco, and at Hugh & Thom's Foundry, Nevada City. For further particulars, or to see this Pan in operation, call on or address J. B. BAUX, 478-64f Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco.

It tells us truly the Minute, Hour, Day of the Week and Day of the Month.

HORTON'S PATENT CALENDAR CLOCK!

MANUFACTURED BY THE ITHACA CALENDAR CLOCK COMPANY, Ithaca, N. Y., and for sale by W. J. EGBERT, Agent, At JOA M. SEAMAN & Co's, 631 WASHINGTON STREET, San Francisco.

THIS TIME PIECE costs but a trifle more than any other good clock, and is just the article for every well-regulated business house, office, saloon, or, in fact, any place where a handsome, perfect time-keeper is duly appreciated. The Clock has two dials, the first being the same as an ordinary clock, the second has but one pointer, and shows the day of the week, the month and day of the month. It is arranged to mark the days in leap years with equal regularity. It is an eight-day piece, and runs from year to year without change. It can be examined at the Office of the Mining and Scientific Press. 2v12-14f

To Ditchmen, Millmen and Others Requiring IRON PIPE.

M. R. ROSE, CORNER OF 9TH AND K STREETS, Sacramento City, has facilities unsurpassed in this country for the manufacture of IRON PIPE of every description. He also has on hand a deep well FORCE PUMP of his own invention and manufacture, well adapted for oil wells. His tools being portable, pipe can be manufactured on the ground. 19v12

EXCELSIOR PUMP!

THIS DOUBLE-ACTING SUCTION AND FORCE PUMP CHALLENGES COMPETITION for simplicity, durability and power, and will work at any depth. The pistons for Mining Pumps are packed with hemp. The valves are reached by simply removing the "bonnets," thereby avoiding the trouble of raising a long column of pipe. They will raise as much water as TWICE their size of single-acting Mining Pumps, and are sold at half the price. We have never heard of the valves in this Pump being out of order. For their many superior points they are fast replacing all other Force Pumps. Reference can be given where this Pump is working with eighteen others of different patterns, and is pronounced THE BEST; also, from some of the best miners in the State who have them in use. For manufacturers, farms or domestic use, we warrant them the best and cheapest. All sizes adapted to any power or any purpose. For sale by agents throughout the State. J. W. BRITAN & CO., General Agents, 120 Front street, San Francisco. 2v12-3m Send for Price List.

STODDARD'S CELEBRATED WATER FILTERS!

PURIFY RAIN, RIVER, OR SPRING VALLEY WATER. Perfectly pure and healthy. Three sizes. Price, \$12, \$15 and \$18. For sale by S. B. STODDARD, Corner of Battery and Pacific streets. 2v12-3m June 23, 1866.

Union Amalgamator.

This Valuable Invention. IT'S FAST FINDING ITS WAY INTO GENERAL USE, NOT by means of combination of capital and influence, but on the strength of its own merits, and upon the principle that what is known to be good will be appreciated. Practical men acknowledge the UNION PAN to be scientific, the best, the cheapest, and most profitable. It now stands first on the list of all pans in use for the purpose of

Working Gold and Silver Ores. It has been found that a low class of ores, also tailings from Mills, Sulphurets, etc., that will not pay to work with the common pans, may be worked with this and obtain large profits. The UNION PAN is manufactured in two sizes, and capable of operating upon large quantities of ore in the most efficient manner. Parties interested in Quartz Mining, Mills, etc., will find it to their advantage to call and examine for themselves, and see its operation. Gold and silver ores tested by regular mill process, at moderate cost, by STRONG & CO., San Francisco Foundry, corner Mission and Fremont streets, where orders will receive prompt attention. 19v12-3m

BRUCKNER'S Mechanical Roasting Furnace

AWARDED A PREMIUM SILVER MEDAL BY THE The Mechanics' Institute.

THESE FURNACES ARE NOW MANUFACTURED AFTER an improved mode of construction, which GREATLY SIMPLIFIES THEIR OPERATION, and afford a much larger oxidizing surface to the action of heat and atmosphere. The weight of a Furnace nine feet long by four feet in diameter does not exceed one ton.

THE IMPROVED FURNACE May be seen in operation, for desulphurizing or roasting and chloridizing, at Central Mill, Virginia City, Nevada. Parties wishing to erect such Furnaces, are requested to leave their orders with T. KALLENBERG, 416 Market street, San Francisco. 19v12

FLORENCE SEWING MACHINES!

COPY OF THE REPORT OF THE COMMITTEE OF AWARDS AT THE FAIR OF THE AMERICAN INSTITUTE, New York, 1865, TO THE Florence Sewing Machine Company, FOR THE BEST FAMILY SEWING MACHINE.

HIGHEST PREMIUM—GOLD MEDAL!

REASONS: 1st.—Its simplicity and great range of work. 2d.—The Reversible Feed Motion. 3d.—The perfect finish and substantial manner in which the machine is made. 4th.—The rapidity of its working and the quality of the work done. 5th.—The Self-adjusting Tension.

The "FLORENCE" was awarded the First and Highest Premium at the State Fair of California, the only Fair on the Pacific Coast at which any two double-thread Sewing Machines were exhibited in competition in 1865.

The "FLORENCE" received the only premium awarded by the Mechanics' Institute of San Francisco, in 1864 and 1865, to any Sewing Machine, Sewing Machine Company, or Agent. The claim of a competitor to a medal is without any foundation whatever.

Wherever the "FLORENCE" has been brought in competition with other Sewing Machines, it has always been declared the best. It is the most simple, the most substantial, the most efficient, and its use is easily learned. Every Machine sold is guaranteed in the full sense of the word.

Send for Circulars and Samples of Work.

SAMUEL HILL, General Agent, 20-12-14w 111 Montgomery street, San Francisco.

Rubber Belting, WITH COTTON FILLING.

A FULL ASSORTMENT OF 3 AND 4-PLY, NOW IN store and for sale by THOMAS H. SELBY & CO., 2v12-3m Nos. 116 and 118 California street

HYDRAULIC HOSE MANUFACTORY.

THREE SEAMS SEWED WITH TWENTY-PLY TWINE, and guaranteed to stand the pressure of 100 to 200 feet fall. One to three-ply Hose made. All orders punctually attended to. S. HOWARD, 326 Davis street, San Francisco.

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

The Great London vs. the Great San Francisco Earthquake.

London is not generally considered as lying within the limits of the earthquake region, and probably there are few of our young readers who are aware that it was once visited by a shock far more severe than the one by which the inhabitants of San Francisco were so much alarmed in October last. We have just come across a very vivid description of the Great London Earthquake, in a delightful book entitled "The Diary of Kitty Trevylyan." As we are sure the account will prove interesting to our readers, we give it in full. The event took place on the 8th of March, 1750. The description is as follows: "On Friday morning, March the 8th, I was started out of my sleep in the early dusk, before dawn, by a heaving and a jarring, which made me think, in the confusion of waking, that I was at sea again with father and Hugh, and that the ship had struck against a rock and was grating over it. I sprang up instantly, with a vague fear of drowning; but I shall never forget the horror of utter helplessness which followed, when I perceived that it was Aunt Henderson's great crimson-damask four-post bed which was thus tottering, and that it was the gigantic polished oak wardrobe whose doors were flying open, and the familiar white jug and basin which were rattling in that unaccountable way against each other. It flashed on me at once that it was the earth that was moving, and the solid earth itself that was heaving like the sea! My first impulse was to throw myself on my knees by the bed-side; then I committed myself to God, and felt there was something yet that could not be moved! Then followed another shock and jarring motion, the fire irons rattled, the water jug fell and was broken, the wardrobe tottered and strained, and there seemed something more awful in the unwanted noise among these familiar things than there would have been in the roar of a cannonade, or any other strange sound. But besides these noises, and through, and behind, and underneath them, came a low, distant rumble like thunder, which yet was not thunder; not above, but beneath, it seemed quivering through the earth. I sprang to my feet, and wrapping myself in my great cloak, rushed out to mother's room. The frightened servants were already gathered on the landing, crying that the end of the world had come, and wringing their hands and wondering what would become of mistress, who was gone to the early prayers at the Foundry. Uncle Henderson appeared in a night-cap and blanket, and then father in a military great-coat. All had rushed together with the instinct of frightened cattle. No one had thought of striking a light. I crept to mother's bed-side, and kneeling down, pressed her hand in both mine. 'My darling,' she said, 'I am so thankful we are together, * * * for mother thought, like most of us, that the end of the world was come.

Another shock, and jar, and rumble, of that awful underground thunder, and then a fearful crash above us, and a piercing shriek from all outside, with sobs and cries of 'Lord have mercy on me.' Another crash, and another burst of shrieks and sobs. Then there came a stillness, and a hush in the voices outside, and through the silence we heard the wind rustling in the tall elm tree close to the window, and saw that the dusk was slowly creeping into dawn. * * * No messenger after another continued to arrive with accounts of the tottering walls and falling chimneys they had seen, and with wild, incoherent rumors of the ruin and destruction of which they had heard. * * * The chimneys were crashing through the roofs in Great Ormond street, the tiles raining like hail on the pavements, the people shrieking and crying, the streets full of flying coaches, with men on horse-back."

The scene at the large church, where Charles Wesley, one of the great founders of Methodism, was preaching at the time, is thus described: "The walls were shaken so violently that they all expected the building to fall on their heads. A great cry followed, and shrieks of agonized terror. But Mr. Charles Wesley's voice immediately arose calmly above the tumult, saying: 'Therefore will we not fear, though the earth be moved, and the hills be moved into the midst of the sea; for the Lord of Hosts is with us, the God of Jacob is our refuge.'"

This occurred over one hundred years ago, and London has never since been visited by any considerable shock. It may be as long a time before San Francisco will have another "Great Earthquake" to record.

THE RING OF CHEOPS.—One of the most remarkable curiosities, perhaps, in the world, is the Ring of Cheops, which, it is with no small degree of satisfaction we can say, remarks an exchange exists in an American collection accessible to all. Cheops was the builder of a pyramid that bears his name, and as if to make the structure bear his name ineffaceably till its component parts had all crumbled into dust, the very stones and bricks now stamped with his name. And yet he lived 2,450 years ago, and his colossal works were old when ancient nations flourished. The boy Joseph, led a slave to the banks of the Nile, looked up in wonder at them; Moses and the Israelites drew a breath of relief as they receded from their gaze. Yet here we possess the signet-ring of this mighty monarch. It was the crowning prize of Dr. Henry Abbott's life of research in Egypt. The style of the hieroglyphics is in perfect accordance with those in the tombs about the Great Pyramids, and those within the oval comprise the name of Cheops. The details are minutely accurate and beautifully executed. The ring is of the finest gold, and weighs nearly an ounce. This remarkable antique was found at Ghizeh, in a tomb, and now lies among the treasures of the Abbott Collection in the Museum of the New York Historical Society.

Knox's Improved Patent Amalgamator and Separator, With Palmer's Patent Steam Chamber or Die.

At the Golden State Iron Works, No. 19 First street, San Francisco.

Eyes! Eyes!! Eyes!!!
DR. HENLY, Oculist and Aurist, has received from Scotland one of the most miraculous remedies for the benefit of the human eye ever before discovered. It is unparalleled in its effects upon the diseases incident to this organ. It gives wonderful power to the optic nerve, and removes all the granulations from the lids, and all mucous film from the sclerotic coat without the use of instruments. In fact, it works like a charm on the eye, without giving any pain. You feel the effect of the medicine in different parts of the head. It drives the disease back into the system, which is better able to stand it than this tender organ.
Why will you suffer when you can be cured in a few days. Persons who have been blind for ten years have been restored to their sight in a short time by the use of this medicine. I will treat any person's eyes in the State, and I do not give them relief in a short time, I will not charge them anything. Office, No. 751 CLAY STREET, opposite the Plaza, San Francisco.

ANNUAL REPORT OF THE Pacific Insurance Company.

IN COMPLIANCE WITH THE ACT OF THE LEGISLATURE of the State of California, entitled "An Act concerning Corporations," passed April 23, 1850, the Pacific Insurance Company of San Francisco makes the following Annual Report:
I.—The amount of the Capital Stock of this Company is SEVEN HUNDRED AND FIFTY THOUSAND DOLLARS, and paid in GOLD.....\$750,000
II.—The amount of the Assets is ONE MILLION AND FIFTY ONE THOUSAND, FOUR HUNDRED AND TWENTY DOLLARS AND THIRTY-SEVEN CENTS..\$1,051,420.37
III.—The Company has NO DEBTS
IV.—The amount of insurance effected during the year, and which remained in force December 31, 1865:
Fire.....\$12,973,949
Marine.....481,408
This Company commenced underwriting Marine Risks, August, 1865.
V.—This Company insures against the following risks, viz.: BUILDINGS, HOUSEHOLD FURNITURE, MERCHANDISE, RENTS, LEASEHOLD, VESSELS IN PORT AND THEIR CARGOES, and other PERSONAL PROPERTY, AGAINST LOSS OR DAMAGE BY FIRE.
Also, on CARGOES, TREASURES, COMMISSIONS, PROFITS, and WAR RISKS, and ON ALL NAUTICAL AND LAND NAVIGATION RISKS, TO AND FROM ALL PORTS IN THE WORLD.
VI.—This Company will take on any FIRST-CLASS RISK not to exceed \$5,000 (the limit fixed by law), and on all large risks will reinsure to an extent consistent with PRUDENCE in other RESPONSIBLE COMPANIES.

Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make.

HOADLEY'S.
FOUR SIZES,
8, 10, 12, and 15-Horse Power,

HOADLEY'S.
3 to 40-Horse Power.

HITTINGER'S.
THREE SIZES,
5, 7, and 10-Horse Power!

HITTINGER'S.
TWO SIZES,
5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, and Economy, with the minimum of weight and price.
These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes.
Steam can be set up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.
All sizes on hand from 3 to 30 horse power, with and without carriages.
Also, Portable Saw and Grist Mills.
For sale by
TREADWELL & CO.,
18v12
Corner of Front Market and streets.

NEW PATENTS.

CALIFORNIA INVENTIONS.

PROCESS FOR HARDENING WOOD.—We understand that certain parties in this city have discovered a process for hardening wood which, if it accomplishes all that is claimed for it will prove of great value. It is said that by this process any ordinary soft wood can be made durable and almost as hard as the hardest stone, and capable of receiving a high polish. If such a discovery can be fully realized, and made economically practicable on a large scale, it will present wonderful advantages in ship building, pile driving, and in material for pavements. The blocks of wood thus treated may be laid down without any further preparation, and will present a surface of the durability and hardness of iron. It is expected that operations will be commenced shortly, as soon as the proper apparatus can be secured.

QUARTZ STAMP MILL.—Alex. Herdlein, Egan Canon, Nev.—This invention consists in the arrangement of double-armed levers, the long arms of which are about ten times longer than their short arms, in combination with the stamper and with suitable cranks or eccentrics on the driving shaft, in such a manner that, by the assistance of the double-armed levers, the operation of raising the stamper is facilitated and the number of blows of each stamper can be increased almost to any desired number per minute without danger of having the wipers come in contact with the descending tappets.

QUARTZ CRUSHER.—John T. Boanell, Columbia, Cal.—This invention relates to that class of quartz crushers which are provided with rising and falling weights, pounders, or stamps, and it consists in a novel and improved means for operating the weights, pounders or stamps, whereby the machine may be worked by hand with a very moderate expenditure of power.

OTHER PATENTS OF GENERAL INTEREST RECENTLY ISSUED.

WATER ELEVATOR.—J. C. Barrett, Stamford, Conn.—This invention consists in a novel application of the "lazy tongues" system of levers for elevating water for domestic use, and it consists in the means employed for actuating the system of levers and in the means for tilting the bucket.

DESULPHURIZING GOLD AND SILVER ORES.—Anthony L. Fleury, Pittsburg, Pa.—I claim, 1st. To treat sulphurets containing gold and silver in the way and for the purpose specified. 2d. The compound obtained, denominated as metalliferous coke, when prepared as above specified.

QUARTZ CRUSHER.—Thomas Shaw, Philadelphia, Pa.—I claim the employment of metal balls secured by chains to a revolving wheel, the whole constructed and operating for the purpose described.

PATENTS can be obtained for citizens on this Coast through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. In one-half the time it takes to operate through Eastern agents. From our familiarity with the subject of most California inventions, and the benefit arising from personal explanations, we are prepared to present claims with greater accuracy than could reasonably be expected of distant agents.

DEWEY & CO.,
Patent Agents, 505 Clay street, San Francisco.

CARRIAGE TRIMMERS.—Moore & Crego, corner of Battery and Market streets, in the Oriental Hotel Building, are ready at all times to attend to the Trimming of Carriages of all descriptions, and hope, by strict attention to business, to merit a share of the public patronage. Particular attention paid to repairing. This is the only establishment in the city that attends exclusively to the above business.

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

By MAIL.—The MINING AND SCIENTIFIC PRESS will be sent by mail to any part of the civilized world. In case of removal, subscribers have only to inform us of the post-office address of their old and new location, and the paper will be sent accordingly.

ONE HUNDRED DOLLARS REWARD!!!

The above Reward will be paid to any one who will produce evidence of a failure of any of HENDY'S IMPROVED SELF-DISCHARGING CONCENTRATORS, Patented February 27th, and April 17th, 1886—which said amount is deposited for 60 days with Palmer, Knox & Co., No. 19 First street, San Francisco.

June 23d, 1886.

J. HENDY, Patentee.

Hendy's Improved Patent Self-Discharging Sulphurets

PRATER CONCENTRATOR

Is Receiving Universal Favor.

Reference is made to the following Mills which have them now in use:

BENTON MILL, Bear Valley, Mariposa County.
LOUISIANA MILL, near Conterville, Mariposa County.
OPHIR MILL, near Newcastle, Placer County.
C. H. SCHAEFER'S MILL, Doty Flat, Placer County.
CONY MILL, Jackson, Amador County.
SPRING HILL MILL, Amador, Amador County.
GOLDEN GATE MILL, Volcano, Amador County.
RAWHIDE MILL, Jamestown, Tuolumne County.
TRIUMPH C. & S. M. CO., Lower California, Mexico.

And in use in many other parts of this State; also in Idaho, Arizona, Colorado and Mexico. As a further evidence of its worth, orders have been received recently from the proprietors of the following mills, all of whom are using these Concentrators, or have works in the immediate neighborhood of mills using them, viz: One Concentrator for the Ophir G. & S. M. Co., near Newcastle, Placer County, ordered by Welty & Foster, who are using two Concentrators; one Concentrator for the Benton Mill, Mariposa County, ordered by Messrs. Dodge & Bro., of this city, who are using seven of them in the same Mill, one Concentrator, ordered by Messrs. Bigelow & Bro., of this city, for the Cony Mill, Jackson, Amador County, where they have already three of them in operation. They may be seen in operation at the GOLDEN STATE FOUNDRY, No. 19 First Street, San Francisco.

DESCRIPTION:

FIGURE 2 is a sectional view. C, is the Hopper in which the tailings are thrown. The tailings then distribute on the Distributor, B. The tailings enter the pan, A, at its periphery, and the debris discharges near its center, and passes off in the spout, F. The sulphurets discharge at gate, E, amalgam and quicksilver at plug, I. J, is a horn-shaped cavity for collecting quicksilver and amalgam. S, is the sulphurets. M, M, the agitating bars, with copper plate, coated with mercury. The agitating bars operate on top of the pulp. They are acknowledged to be, by those using them, a valuable improvement. [An extra charge of \$15 is made when these bars are furnished.] The pan, A, shows a curve-linear bottom, which gives a more precipitous descent near its center, for the purpose of forcing the sulphurets towards the periphery. It will be noticed that the centrifugal force diminishes towards the center of the pan, for which reason the inclination is increased for the purpose above mentioned.

The pan, A, has an inclination at its periphery, towards the gate, E, for the purpose of forcing the sulphurets to the discharge gate. At the same time the center rim is level; the sulphurets, S, being forced by the oscillating motion of the machine, and are discharged through a small opening in the pan at gate, E.

JAMESTOWN, TUOLUMNE COUNTY, CAL., July 18th, 1886.
JOSHUA HENDY, Esq., San Francisco:—MY DEAR SIR: It gives me pleasure to inform you that the four "Improved Self Discharging Prater Concentrators," which I purchased from you, have now been in operation in the Rawhide Mining Company's Mill for more than two months, and have more than realized my expectations. I am free to say it is the best Machine for saving Quicksilver, Amalgam, and Sulphurets that I have ever used or seen used for that purpose. I shall take pleasure in showing any one interested the Machine in operation, who will call at the mill. I shall need four more as soon as the balance of our mill is completed. Yours truly,
R. P. JOHNSON, Superintendent Rawhide Mill Company.

A Circular giving further particulars will be mailed to any part of the United States free of expense. Address,
JOSHUA HENDY,
402 Montgomery street, San Francisco, Room 3, Fourth Floor.

THE RECENT EARTHQUAKE.

INDICATION NOTED BY PROF. BLAKE, AT OAKLAND.

EDITORS MINING AND SCIENTIFIC PRESS:—The earthquake shock of last Sunday morning, about twenty minutes before one o'clock, was so peculiar in its character at Oakland, that I think it worthy of a note in your journal. It was different from any of the earthquakes I have before experienced, being more like an explosion, accompanied by a distinct sound or concussion of the air. It appeared to come from the southeast corner of the house, and the first impression was that a heavy object had fallen upon the floor, and next that a large gun had been fired. It was much like the sound of a blast in a mine when heard above the surface. The concussion was so marked that no notice was taken of the motion of the house. I was standing at the time facing the north, and at once turned around to see what had fallen. It does not appear that any sound was heard by persons in San Francisco.

I am certain that this earthquake proceeded from a subterranean explosion; and that, like most of our earthquakes, it was comparatively local, the explosion not being at a very great depth below the surface.

August 23d, 1866. W. P. BLAKE.

THE HAGAN ROASTING FURNACE.—The Pacific Ore Company, of this city, have in operation at Grass Valley, Nevada county, a large roasting furnace on the Hagan plan, which is said to be a success. The furnace is of fifty tons capacity, and is expected to desulphurize ore at the rate of twenty tons per day. The furnace has been used several weeks, and we are informed that no difficulty is found in amalgamating the gold from the most refractory sulphureted ores, after they have passed through this furnace.

SINGULAR MINERAL DISCOVERY.—At Black Hill, Mariposa county, W. G. Hildy has recently discovered a very singular mineral formation, said to consist of small veins of asbestos averaging about an inch in thickness, mixed with clay, and running through a black serpentine rock. The most singular part of this discovery is that these thin seams of asbestos are rich in gold.

STATE AGRICULTURAL SOCIETY.—J. W. Winans, Esq., has been selected to deliver the annual address before the State Agricultural Society at the ensuing State Fair at Sacramento. Dr. D. J. Macgowan, long a resident of China, and now on his way to that country as agent of the East India Telegraph Company and delegate of our State Agricultural Society, will also deliver a lecture before the Society on "Oriental Agriculture"—probably on Friday evening of the Fair week.

SAN FRANCISCO MECHANICS EQUAL TO ANY EMERGENCY.

The locomotive, A. A. Sargent, built by Booth & Co., of the Union Iron Works in this city, on Monday last made its regular trip with the passenger train, from Sacramento to Alta, a distance of 70 miles, on the Central Pacific Railroad, in the short time of two hours and thirty seconds—for all practical purposes we may call the trip two hours, or 35 miles per hour. When we call to mind the fact that for two thirds of the distance this road is climbing directly up the flank of the Sierra Nevada, much of the distance at a grade of from 100 to 116 feet to the mile, and often on curves of 500 feet radius, we may well be astonished at the power performed. If we take into account the peculiarity of the duty, we doubt whether any superior work has been recorded of any locomotive, in any part of the world. There are several Eastern-built locomotives on that road, but this San Francisco built machine is the only one which has ever been able to accomplish any such work as is here recorded.

Our San Francisco mechanics have more than established a reputation of equal skill with the artisans of any part of the world, in whatever they have attempted competition. A few years ago the idea of making this a manufacturing city was scouted as simply ridiculous; now there is scarcely anything which enters largely into consumption here, which experience has not fully proven we can produce, and that as cheaply and as skillfully as any other people. Originally there was no reason why any of the great manufacturing cities of the Atlantic States or of Europe should become such. None of them command any special advantages of position. They owe the origin of their importance rather to the indomitable will and skill of their founders, who sought to remove unfavorable obstacles of position by the artificial aid of railroads, steam, canals, etc., which might be employed to bring them into more convenient communication with the great commercial centers from whence they draw the raw materials for their manufactures, and to which the results of their labor are returned for a market. It is on this account that such cities have generally become the center of diverging roads of iron and steam, which insures to them a permanency of population and an increasing flow of wealth.

San Francisco has none of these obstacles to overcome. Situated directly upon the great high road of commerce between Eastern Asia and the entire continent of North America and of Western Europe, and forming the converging and diverging point of the entire system of interior and exterior intercourse, she has but to place herself in a proper position to enjoy and reap the benefits of the vast business which will naturally pour itself into her lap. To enable her to do this her enterprise and liberality has drawn around her the best engineering and mechanical skill of the world. That skill has made itself apparent, wherever and whenever it has been called into exercise. Under its magical influence numerous branches of industry have already grown into respectable importance; and it has been proved by actual experiment that all kinds of heavy machinery,

whether for extracting the precious metals from our golden rocks and sands, for climbing up the steeply graded iron track of our mountain railways, or for propelling floating palaces along our inland waters, can be made here as cheap and as well as at any locality; while at the same time it is infinitely better adapted to our peculiar wants than any which can be imported from either the Atlantic States or England.

Nothing ever comes amiss. Whenever our mechanics have been called upon to produce a machine to meet any industrial want, they have always succeeded. We may instance particularly the diverse character of locomotives required for the various uses on this coast, as exemplified in the tractive power of the A. A. Sargent on the steep grades of the Pacific Railroad; the lighter locomotives constructed for the level grade and the light work of the Alameda road, and the still more peculiar work of applying steam power to cutting down our sand hills and filling up the irregularities of the naturally rough surface upon which our city is built. In all the multifarious applications of mechanical skill which our mechanics have been called upon to devise, they have proved themselves fully equal to the call which has been made upon them; and have shown to the satisfaction of capitalists that there need be no blank on this coast in the whole round of the world's manufacturing products.

FROM PAHRAAGAT.—Mr. S. B. Pike, the inventor of the Little Giant quartz crusher, has just returned from the Pahraaagat mining district, Nevada, from which he brings highly favorable accounts. Mr. Pike spent some two months there, and examined all the principal ledges of the district which have been opened. He assayed ore from some thirty of the ledges, selected in every instance from average samples. These assays run from \$4 to \$2,248—averaging \$364.93—all surface ores. There are two systems of ledges, an east and west and a north and south system. The latter are very large and rich, while the former are mostly small. The ore generally shows copper, either as a carbonate or glance. The country rock enclosing the veins is a magnesian limestone, flanked on the east and west by massive cropings of barren quartz. The entire area upon which the mines are located is not more than four and a half miles long by an average of one mile in width; outside of which nothing worthy of note has been discovered. These mines are located about eight miles east of what is known as the Pahraaagat Valley. The principal mines of the district are the Illinois, Santa Rita, Nevada, Webster, Lillie and Jessie, Utah, New Hampshire, and Ourang Outang. There are many others which will doubtless prove valuable mines. There will be a 5-stamp mill in operation there within two months. A 10-stamp is now on its way thither.

QUICKSILVER, in a pure state, has been found at Leech River, British Columbia. After one day's sluicing a company found one pound and a half in their boxes.

THE SATURDAY ADVERTISER, just started by C. L. Yates, San Jose, is a neat little sheet. Its publication is a practical idea.

AVENTURINE—WHAT IT IS AND HOW TO MAKE IT.

Aventurine is a mineral compound, composed chiefly of quartz, and remarkable for the brilliancy with which it reflects light; this effect being generally produced by fine points of mica imbedded within the crystalline mass. It is quite extensively employed in jewelry and other articles of ornament in some parts of Europe. It was first produced, artificially, in Venice, where, in the middle ages, the manufactures from it constituted quite an important business; but the process was kept a secret, known to but few, until it was finally lost. Many years ago, however, it is said that a Venetian jeweler accidentally hit on a certain combination of minerals which produced an article almost as perfect as the relics which had been preserved from the early Venetian artists. His process was communicated to some Neapolitan jewelers, by whom and their descendants the secret has been preserved to this day, greatly to the profit of the Neapolitans, who have thereby been enabled to retain almost exclusive monopoly of that class of jewelry and ornamental trinkets. Various efforts have been made by manufacturers in other parts of the world to discover the secret.

In 1850, at the display of Medieval Art, by the London Art Society, a *tazza* of imitation of aventurine, or aventurine glass, as it is now commonly called, was exhibited, which attracted much attention. Many such things are preserved in European cabinets as relics of the early perfection of the art.

About a year since, M. Polouze made a written communication to the French Academy, in which he disclosed a method of his own discovery by which he had been able to produce aventurine, equal if not superior to that of the Venetians. His process consists of 80 parts of oxide of iron, 40 parts of protoxide of copper, and 300 parts of powdered glass, submitted to a high temperature for twelve hours, and then allowed to cool gradually. Another process is as follows: 40 parts of bicarbonate of potash, 50 of carbonate of lime, 100 of carbonate of soda, and 150 of white quartz sand, heated and cooled as the first.

A FRUIT-PRESERVING SOLUTION.—A Mr. Spear announces the discovery of a new agent for preserving fruit, which he calls a "Fruit-Preserving Solution," and which he claims will preserve fruit, with all its natural freshness, by being immersed in his solution and kept in jars or bottles merely corked, without being air-tight. He has exhibited to the editor of the *New York Mining Journal* fruit so kept one, two and three years, which still retains its original flavor. The solution has been analyzed by several chemists and pronounced perfectly harmless. Information with regard to this new preservative agent can be obtained of L. P. Worrell, general agent, 91 Hudson street, New York city.

LIBERALITY OF ARTISTS.—Messrs. Bradley & Rulofson, the leading photographers in this city, tendered the use of their spacious gallery for the benefit of the Ladies' Protective and Relief Society on Wednesday last. They also donated the materials used during the day. The proceeds amounted to over \$200.

Communications.

In this DEPARTMENT we invite the FREE discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Reese River Correspondence.

[Continued from Page 386 Vol. XII.]

MESSRS. EDITORS: Very little labor is being done on the mines in the immediate vicinity of Austin, at present, the attention of all being directed to other districts. In truth, there is very little encouragement for claim holders, or even agents of companies to do work here, there being a great reluctance shown by the heads of mining companies to pay necessary demands, such as labor, aside from expenses caused by extra machinery, etc. There also seems to be a general dissatisfaction shown by Eastern capitalists, in their investments in and about this district, caused principally by the delay in receiving their oft promised dividends. How much longer they will have to wait for them, depends wholly upon their action. They see that their neighbor makes headway with his mine, and is getting returns therefrom; while they, after having spent much the most money, still get nothing. If they would view the matter in a practical light, they would very readily see where the difficulty lies.

The shipment of hullion from Austin for the month ending July 31st, was \$80,674.61. The National Bank having shipped \$51,076.70, and Wells, Fargo & Co. \$29,597.91, being \$20,841.65 less than the shipments for June. The falling off was caused by the suspension of operations at the Manhattan, Boston, and Midas mills. The California, Keystone, and Ware mills being the only mills running during the month of July.

It must look strange to parties elsewhere, that with all our mills and the abundance of quartz we have here, there cannot be kept running over thirty-five stamps. Such seems to be the case, however; and hence the question arises, Why is it? Can it be, after the outlay of millions of dollars in this district in mining machinery and mills, the whole district cannot produce more than thirty or forty tons of ore per diem? Yes, so it is! and why? The answer is very simple, has been often repeated, and should be readily understood by all reasoning beings: That the district has been, and is daily being literally hatched by inexperienced managers, who apparently have only one object in view, to wit: To disgust their employers, and bring down their maledictions through their ill success, on the whole silver-bearing world; and I will say, that as far as this section is concerned, they have pretty nearly accomplished their end. Had it not been that adventurous men had prospected, elsewhere, and after diligent search, hard living, and the endurance of privations of all kinds had discovered and opened, to the satisfaction of every one, larger and better ledges than have yet been found here, it would have been a "dead heat" with us for some time to come. As it is, the attention of all is being directed to Philadelphia, Twin River, Hot Creek, Northumberland, and other districts south and east of this place.

This city is (comparatively speaking) almost depopulated on account of these outside developments, and it is not a "wild goose chase" this time, that our miners are after; but a plain case of large, well-defined and rich ledges.

THE HIGH BRIDGE LEDGE.

It is conceded by all, either "knowing ones" or the hard fisted, hard working miner, who believes only that which he sees and has indisputable ocular demonstration of, that the High Bridge ledge, in the Philadelphia district, is the largest and best ledge yet shown to the world. Men who have worked with pick, shovel and drill, in the great Comstock, say that this ledge far exceeds it, both in the quality and quantity of ores. The ledge has been opened by a cut run through it from wall to wall, at a perpendicular depth of forty feet, showing a vein of twenty-five feet in width, with well defined smooth walls, thereby exposing to the light of day, and to the greedy gaze

of all that can possibly get to see it, the finest body of ore ever yet discovered in any country. I am safe in saying that the whole ledge matter will yield \$200 per ton. Dr. Geller, one of the owners, hauled two tons from the mine to his mill, in this city, where it was reduced, and produced 2,020 ounces of crude hullion, which, when melted and refined will show a working of over \$750 per ton; (this of course was selected ore).

Other large ledges have been discovered in that district, but none of them are as yet as fully developed as the High Bridge. Success to the owners, and to all others, who display a like energy in the discovery and development of their mines.

Buel has removed a mill from Austin, and erected it near High Bridge, all inside of six weeks, and now has it in running order.

TWIN RIVER DISTRICT.

Much attention is being directed to Twin River District, large ledges are being opened with success to their owners, Mr. G. B. Montgomery of the Twin Ophir and Fairmount mine, has conveyed about fifty tons of the ore to the Keystone mill of this place, a distance of fifty-five miles. The ore, though of a character difficult to reduce, being composed of base metals, iron, zinc, antimony, sulphur, and arsenic, with little or no quartz, in view, was worked by the usual roasting process, within nineteen per cent., and yielding \$100 per ton in silver. The Canada ledge of the same district, owned by E. S. Davis and others, is an enormous mine, large, well-defined, and has worked here per mill process, \$175 per ton. Another lot of several tons is now being brought here for trial. The Buckeye ledge, as well as the celebrated Murphy, still hold their own, growing better as developed.

OTHER DISTRICTS.

In the discoveries made in these new districts, and the energy displayed by the discoverers, our country will be rebuilt, and confidence will be again placed in the mineral worth of the country; but some time must elapse before machinery can be arranged on these permanent ledges. When such is done, there will be no lack of hullion. That is "what the matter," and in truth, is the only salve that will heal the wounded spirits, and repair the damaged purses of our sanguine speculators and mill owners.

We all look forward to that time with pleasure, knowing well, that it is only a matter of time; but we have all waited so long for something to "turn up," that the least reverse in mining matters again brings a cloud over our future. As it is now, let there be success proven in a few instances, and others will then take hold with a will, when prosperity will be with us; but while this dormant indifference predominates with our capitalists, as in this district, little will be done towards our advancement.

PROGRESS.

Austin, August 12, 1866.

[Written for the Mining and Scientific Press.]

From Sierra County.

BY AN INDEPENDENT CONTRIBUTOR.

EDITORS PRESS: Downieville, the county seat of Sierra, situated at the junction of the North and South Forks of the North Yuba river, is a noteworthy place, not only for its geographical position in the center of a rich mining locality—both placer and quartz—but also for its being the head of wagon-road navigation, through and from which the various placer mining camps and quartz mines receive their supplies.

The placer yield of her gold fields has been so bountiful until a recent date, that but very little attention has been paid to the more reliable and permanent industry of quartz mining, which is now attracting considerable attention. Rich veins are being daily discovered and rapidly developed, while the placer yield is by no means exhausted. Sierra, to-day, has probably a greater area of placer fields, as yet virgin, than any other county in the State, owing principally to the nature of its deposits (the blue lead) being buried hundreds of feet in depth by basaltic lavas, requiring expensive and systematic explorations to develop them. Her area of hydraulic diggings is surpassed by none, either in richness or extent, and her river beds are not yet exhausted, but are periodically worked, yielding satisfactory returns.

As I before remarked, quartz mining, as a business, has received but little attention, as it requires both capital and mining and mechanical skill to develop and successfully work them. Wherever opened and tested, in every instance they have paid bountifully. In some few instances the operator has abandoned his

property after the line of decomposition has been reached, above which the sulphurets, which are principally iron, have been oxidized by the oxygen of the atmosphere and other deoxidizing agents, and the gold freed. Below the water-line the gold is found firmly held in the sulphuret, and crude manipulations, by simple amalgamations, the only process in use here, has failed to give a satisfactory result. Miners have become discouraged and thrown up the sponge.

Of the most notable mines in this vicinity that have a record, we find the Sierra Buttes company, Independence company, Keystone, American Hill, Primrose, Gold Valley, Spencer & Gray, Gold Bluff, Montpelier, Sailor, Oro, and Slug Canon companies, the most of them in successful operation, others in a state of development, while there are many others of recent discovery that bid fair to become properties of great value, and of which I will give a more detailed account in my next.

Downieville, August, 1866.

Vin.

[Written for the Mining and Scientific Press.]

The Mines of Idaho.

EDITORS PRESS:—Being a constant reader of your very valuable paper, I have often wondered why you do not give more space to the mining interests of Idaho, and I have partly made up my mind that it is not your fault altogether, but that you have no correspondents in this part of the world. Now, being myself a "miner," and one of the pioneers of Idaho Territory, I feel that a few observations on the quartz mines of Idaho would not be amiss in the MINING AND SCIENTIFIC PRESS; and, furthermore, owing to the many false impressions which have gone abroad in regard to the mines of our Territory, I wish to show the cause of these misstatements.

The quartz mines of Idaho embrace Boise, Alturas, and Owyhee counties—the latter silver. But I will confine myself more particularly to the interests of Boise county, being more intimately acquainted there. Starting with Idaho City and vicinity, I will commence with the Illinois, owned by Messrs. White, Harmer & Co. This company have a fine 10-stamp steam mill, which has been at work for nearly eight months, and one 20-stamp mill on the ground, but not put up. Their mine is now well developed, and is paying very handsomely. It is located about four miles north of Idaho City, and they employ about twenty hands.

Then we come to the Middleton mine and mill, located about half way between Idaho City and Centerville, on the divide between Elk and Grimes Creeks. This mill has been running about three months, and has yielded, on an average, twenty dollars per ton. They have a 10-stamp steam mill, and work about fifteen bands. This mine is not quite as well developed as some others, but, without doubt, will prove equal to any in the Territory when fairly in operation.

Next we come to the Elk Horn Gold and Silver mining company's mine and mill, which is situated on the head of Elk Creek, about fourteen miles due north from Idaho City, and about seven miles due east from Pioneer City. This company was incorporated in 1864, under the general laws of Idaho Territory. They own 5,400 feet, and have prospected the mine to the depth of 300 feet. They are now running another level 100 feet deeper. They have about 1,000 feet of tunnel, well constructed, and in fine shape. The quartz, since commencing to crush, has averaged over forty dollars per ton, and has paid as high as \$140. The principal part of the stock is owned in Pioneer City. The officers of the company are: C. L. Harrington, President; Joshua Saunders, Vice President; W. W. Chapman, Jr., Secretary; C. E. Freeman and John R. Miller, Trustees. This company started without a dollar, and is now entirely out of debt, and will soon begin to declare dividends. More anon.

Idaho.

Pioneer City, August 9th, 1866.

THE OIL STONE mine recently discovered by Charles H. Eaton and Wm. C. Holmes, near the Merced river, between Horse Bend and Don Pedro Bar, is attracting a good deal of attention. Barbers and others competent to judge say that the stone is superior to any other kind now in use. Since the first discovery, the mine has been opened and found to be very extensive. Specimens of the stone have been left at this office.

QUITE a poetical child was the little one that said: "Mother, listen to the wind making music for the leaves to dance."

ANNUAL REPORT OF THE SAVAGE MINING COMPANY.

The annual reports of the President, Superintendent and Secretary of this company, for the fiscal year ending July 10th, 1866, are highly encouraging to the stockholders. The President assures the stockholders "that a profitable future awaits them," and that there is no apparent reason "why the earnings of the mine hereafter will not be sufficient to meet all its current expenses, and pay satisfactory dividends." The financial condition of the company a year ago was anything but flattering. The debts at that time, past due, amounted to the large sum of \$111,099, while those already incurred, which had to be provided for during the current year, reach the sum of \$306,138, or a total of \$417,237. During the past year the whole amount of this large indebtedness has been paid, with the small exception of \$12,800, which was to have been paid in a few days subsequent to the date of the report. The whole amount has been paid out of the earnings of the mine, with the exception of one assessment of \$80,000. The present amount of liabilities is only \$59,730, to meet which the company has cash assets of \$100,259, leaving a cash balance, over all liabilities, of \$40,529. During the year, 29,535 tons of ore from the mine have been reduced, yielding \$1,251,753, or \$42.39 per ton. The cost of reduction, including improvements upon the mill, has been \$16.74 per ton. The cost of raising 30,652 tons, has been at the rate of \$18.06 per ton; which includes a reasonable amount of sinking, prospecting, and other dead work necessary to keep the mine in good order and properly developed ahead. The profits on the ore, over and above the current expenses of raising and crushing, have been \$7.59 per ton; without taking into account \$13,438 received for ores sold, on which there was no cost to the company for reduction.

The Superintendent speaks very encouragingly of the present appearance and condition of the mine. There is a very large amount of good ore in sight; while the developments in the mine itself, and in the adjoining claims, gives evidence of the most encouraging character with regard to those portions of the mine which have not yet been explored.

The total yield of the mine up to July 10th, 1866, has been \$4,243,660. The average yield per ton, previous to the present year, has been \$44.35; the average for the present year has been \$42.39—exclusive of some 200 tons of very rich ore which has been sold at the mine and in Europe. The original main shaft of this mine has reached a depth of 520 feet; the new "Curtis shaft" is now down 425 feet. The machinery now at the mine is considered sufficient to work the same to the depth of 2,000 feet.

The President, in closing his report, makes the following very proper suggestions:

All mining enterprises on our coast have so many interests in common, that it seems to me there should be cultivated a mutual and better understanding between those engaged in the various branches of mining, and particularly with those companies engaged in the production of the same metal.

Organizations have always existed by those engaged in like occupation, for the purpose of information, advancement and protection.

Mining officers have committed to their care and management a vast amount of very valuable property; therefore, to give proper direction and obtain the advantages of experience, it would be well that they form themselves into an association, for the purpose of exchanging the knowledge and experience acquired in the modes of working mines; the manner of treating ores; systematize the price and management of labor; to adjust questions that may arise between companies, and devise proper means of defense against blackmailing attacks and malicious trespasses. Much good and certainly great improvement might grow out of such an organization.

THE SAN JOAQUIN AGRICULTURAL FAIR AND INDUSTRIAL EXHIBITION will be held in Stockton, commencing on Monday, September 18th, and will continue four days. We acknowledge the reception of an invitation to be present.

FRANCE has 11,500 miles of navigable streams.

Mechanical.

ENGLISH OPINIONS.

The *Engineering* says: "We believe our Yankee brethren make an engine better adapted to rough, and even to ordinary lines, than our own, and, on the other side, we consider our engines simpler and stronger for their work. A Yankee boiler would burst, by hydraulic pressure, long before ours would give way, and yet they carry as high steam as we."

Mr. Norman Russel says, respecting our beam-engines:

The American steamboat engine has long been a subject of wonder to the English engineer. It is ugly, straggling, and inconvenient looking; its compactness, and want of snugness and economy of room, make it the reverse of everything we think good in a steamboat engine. It certainly made the same impression on me that it has done on all my countrymen, but it was at first sight, and at first sight only. Daily the unfavorable impression became mitigated by familiarity, and after a careful study of its details and qualities, I do not think it possible to design an engine more admirably fit for its use and purpose, under the circumstances where it is applied. In this country there is not a single engine which can be said to be entirely English, and pre-eminently suited to any one purpose. The American walking-beam engine, on the other hand, is universal in the States, and acknowledged to be best suited to their Eastern river navigation. I think it will be admitted, therefore, that the permanence of this kind of engine in the American steamers must be held as *prima facie* proof of its excellence, and that it is entitled to our respectful consideration, and likely to reward our careful study.

I have examined the structure in the best workshops of America, and have watched its practical working in their best steamboats. I have satisfied myself that it is cheaper in construction, lighter in weight, more economical in management, less costly in repair, more durable, and better suited for high speed than any of our own engines would be. I think that for the navigation of large rivers, like those of China and India, it might be adopted with great advantage, and many of its details, indeed, might be adopted with advantage in any engine.

A NEW AMALGAMATOR.—There is now being made at the Sacramento Iron Works, says the *Bee* of that city, a newly invented amalgamator, which promises to supersede all others now in use. A miniature edition of this amalgamator has been in operation in that city two or three months. It has operated on tailings from Nevada, El Dorado, Amador and other mining counties, and has never failed to call the cast-off tailings to account, advantageously. If the invention possesses all the power which the quartz miners with whom we have conversed claim for it, it is a valuable invention.

ECONOMIC RESULTS are obtained in burning fuel, by feeding the fire from below, and thus consuming the fuel from the surface downward, instead of from below upward, as usual. The air admitted is heated somewhat by the lower strata of fuel before it comes in contact with the hot coals, which assists in a very marked manner the complete combustion of the carbon. In a puddling furnace, near Glasgow, Scotland, which had consumed 41 cwt. of fuel, only twenty pounds of unburned residue was found. The modifications necessary to carry out this improvement under boilers are few and inexpensive, and the results so good that at the Gartness Works, near Glasgow, the weekly returns show a saving of one-third.

A GOOD CEMENT.—Gutta percha when dissolved in chloroform, so as to make a fluid of the consistency of honey, produces a good cement. When spread, it will dry in a few moments, but it will soften by heating. Small patches of leather can be cemented on boots by its use, in such a manner as to almost defy detection, and some shoemakers employ it with great success for this purpose. It is waterproof, resisting all the elements but heat.

AN ALLOY consisting of ten parts of cast iron, ten of copper, and eighty of zinc, does not adhere to the mold in casting, and it is of a beautiful luster when filed and polished. The most fractious metals are melted first, and the zinc last, in making it.

A GERMAN, named John A. Heyl, living in Boston, has invented a method for lighting all the street lamps in a city simultaneously. The lighting of lamps by electricity is no new thing, but what Mr. Heyl claims as the new feature in his invention is a stop-cock combined with an electric battery, by means of which the operator at any central point can turn the gas off or on, at his pleasure, at the same time igniting it with the electric battery. The stop-cock is the original feature of the invention, any number of which can be operated at the same time by a piece of platinum wire. To ensure the wind blows the gas out, it will ignite again of its own accord from the heat which is retained in the wires, without any electricity whatever.

SAN FRANCISCO AS A MANUFACTURING CITY. It appears from an official statement, compiled from the census of 1860, that the city of San Francisco at that time, although rating as the fifteenth city in point of population, stood as high as the ninth in respect to the value of her manufacturing investments and products—a most remarkable showing for a city at that time but eleven years old.

AIR-HAMMERS.—Mr. Grimshaw's high speed compressed air-hammer is now employed at Birmingham for various stamping and forging purposes: at Glasgow for copper-smith's work, and at Sheffield for steelwork. The machine consists of a force-pump supplying compressed air to a reservoir, and a working cylinder and piston similar to those of a steam-hammer; having arrangements for varying the action of the hammer as required, and increasing the rapidity of the blows, which may attain a maximum of 800 strokes per minute. The largest hammer yet put to work has a cylinder $8\frac{1}{2}$ in. in diameter, and a stroke of 28 in., and the pressure may be adjusted to any amount from five pounds to forty pounds per square inch. Several steam-hammers of from four to ten hundred weight are working at Sheffield, with which 500 or 600 blows per minute can be struck if required.

WROUGHT IRON DRUMS FOR PULLEYS.—We learn that Messrs. Hudswell & Clarke, of England, are now making a number of drums of wrought iron. The drums are only about half the weight of those of cast iron, and by their use the weight upon the bearings of the shafting is much reduced; belts also are found not to slip on them as they do on cast iron drums, and last much longer; in fact, at Messrs. Hudswell & Clarke's own works they state that they have been enabled to reduce their belt account one-half since they have used the wrought-iron drums.

OBLIQUE BELTS.—It sometimes happens that it is necessary to lead a belt obliquely from a pulley or fly-wheel, and in such cases much trouble is frequently caused by the belt slipping off. This can, in very many instances, be prevented by fastening a strap of thick leather, of a less width than the belt, around the center of the fly-wheel or pulley. The leather strip may be secured by counter-sunk copper screws passing through it, and tapped into the rim of the wheel.—*Engineering*.

GUN TUBES.—It appears that the steel tubes of the Woolwich guns, although hardened in oil, will not withstand the action of the powder and the bite of the shot. In many cases the steel tubes have been deeply scored, and it is a question which, we believe, has been seriously mooted, whether they shall not, in future, be wholly abandoned.—*Engineering*.

PROFESSOR ADOLPH found that hardened steel wire dissolved in hydrochloric acid without residue, whereas the same steel in the softened state yielded by such action a dark flocculent carbonaceous residue.

PROF. HOBKINSON has shown that strains, however feeble, if long applied, produced some permanent elongation or contraction in bars of iron.

THE *Zanesville Courier*, in noticing the contemplated visit to that city of Mr. George Peabody, the celebrated London banker, says: "Among the most benevolent deeds of this world renowned humanitarian, is the gift of \$50,000 apiece to each of his four nephews in the East—among them, Mr. Arthur Peabody, former local of the *Courier*."

A NEW YORK city correspondent says that the residence of A. T. Stewart, corner of Thirty-fourth street and Fifth Avenue, is nearly ready to move into. It eclipses any private building on the continent, so it is said, and will cost, without any furniture, \$2,500,000.

Scientific Miscellany.

EXTREME DELICACY OF PHILOSOPHICAL INSTRUMENTS.

It is wonderful to observe the great degree of perfection to which art has arrived in the construction of instruments for philosophical purposes. As an evidence of this, we may mention a galvanometer, which was manufactured a few years since in the city of Berlin for the great English experimentalist, John Tyndell, F. R. S., etc. The galvanometer is an instrument for measuring the force of the galvanic current. In this instrument two magnetic needles are used, one of which is surrounded by a copper wire, insulated or encased with silk. This wire must be absolutely pure copper; so delicate is this instrument, if properly made, that the least particle of iron in the copper wire will derange its action. In preparing the instrument above alluded to, such a derangement was noticed, although the wire was proved to be absolutely pure. After much research, the derangement was found to exist in the infinitesimally small amount of a compound of iron used in the green color of the silk, with which the wire was covered! White silk was substituted, and the derangement disappeared.

Again, we have recorded an instance of a pyrometer, constructed to measure the degree of heat transmitted to a piece of iron. The iron employed was an upright bar, two feet long, of sufficient diameter to stand upon its end. A mirror was connected with the top of this bar, from which a beam of light was reflected upon the wall of the room, by an electric lamp. When the bar shortened the mirror turned in one direction; if it lengthened, the mirror turned in the opposite direction. Every movement of the mirror, however slight, was multiplied by a long index of light, which was made to move through a corresponding space upon the wall. A mere breath projected against this piece of iron produced a sensible movement of this beam of light. The contact of the flame of a spirit lamp with the iron, caused the index to move through a space of fully thirty feet! When it is recollected that this movement of the index, was caused by the mere lengthening and contraction of that bar of iron, due to the small degree of heat applied, some idea may be formed of the delicacy of that mode of observation.

Another instance may be cited: An instrument known as "Melloni's Pile," which is so sensitive as a thermoscope for measuring heat, that it is said to be sensibly affected by the mere warmth of the hand, when held at a distance of six or eight feet from it.

PRACTICAL SCIENCE—THEORY AND FACT. In the study of nature two elements come into play, which belong respectively to the world of sense and to the world of thought. We observe a fact and seek to refer it to its laws; we apprehend the law, and seek to make it good in fact. The one is theory, and the other is experiment or fact; which, when applied to the ordinary purposes of life, becomes practical science. Thus, by the instruction of thought and fact, of truth conceived and truth executed, man has made science what it is—the noblest growth of modern times.

LIGHTING OF PUBLIC HALLS BY MAGNESIUM. At the Royal Institution, London, Mr. Larkin recently exhibited his method of illuminating public halls by the combustion of magnesium. The magnesium, in a finely-divided state, is showered on small flames of gas, and thus produces a brilliant illumination. It was the first time the apparatus had been publicly exhibited. The flame was flickering, but the pure quality of the light contrasted strongly with the usual gas flames of the burners in the lecture theater.

ROSES, as soon as the flowers have opened and bloomed one day, should have the decaying flower cut away; cutting back to a good strong bud, from which will come a new stem and flowers. Attention to this practice of cutting will keep plants blooming almost continuously.

EFFECTS OF LIGHT ON LEAD PAINT.—Dr. D. S. Price, of the British Association of Science, having noticed that in the glass cases of the last exhibition at the Crystal Palace, London, which were painted with white lead, substances which emitted sulphurous vapors did not darken or otherwise effect the paint, except where the paint was protected from the direct influence of the light, was thereby led to make some investigations into the subject. A number of experiments were tried, and among others a board was painted with white lead, and subsequently exposed for several hours to the action of sulphuretted hydrogen gas, until the entire surface had acquired a dull chocolate color. Glass of different colors was then placed upon it, leaving one portion exposed, or without any glass, and another portion covered with an opaque medium. The board so prepared was then exposed to the action of light, and several impressions were photographed by the light acting through the glass. The glasses employed were red, blue, yellow and violet. The results were that the portions exposed to the light were bleached, that entirely protected by an opaque covering remained unaltered, while correspondingly intermediate effects were produced by the differently colored glasses, varied according to the different degrees of opacity.

NITROLEUM is a new name given to nitroglycerine, by Col. T. P. Shafter, in his late report to the Secretaries of War and the Navy. The Colonel had been directed to make some comparative tests with gunpowder and nitroglycerine or "nitroleum," and the report referred to gives the results of these experiments.

New and Interesting Electrical Experiments.

In an account of some electrical experiments reported in *Poggendorff's Annalen*, M. Henrici states that if water containing hydrogen in solution be put into communication with ordinary water by means of a piece of moist paper, and the circuit be closed by a galvanometer, a current will be produced, directed into the galvanometer, from the ordinary water to the water charged with hydrogen. On this fact M. Henrici bases his opinion that a certain number of phenomena, usually attributed to the action of the oxygen of the air, such as oxydization of iron and other metals, and the putrefaction of vegetable substances, are really due to the decomposition of the atmospheric moisture.

Another experiment made by Professor Tait is recorded among the late proceedings of the Royal Society of Edinburgh, from which it appears that when a horizontal plate is put into a state of rapid vibration, iron filings strewn on the surface, near a point of maximum vibration, are prevented from being scattered to the nodal lines by a magnetic pole held above the plate; but if the pole be held below they are speedily dissipated. If too powerful a pole be used, or if the magnet be held too near the plate, the filings nearest the pole are not dispersed in the latter case. Professor Tait thus explains the phenomena: The filings tend to place their greatest length in the direction of lines of magnetic forces; and thus, when the pole is above the plate, their upper ends incline towards it, so that the agitation of the plate, combined with the magnetic attraction, brings them nearer to the point immediately below the pole. When the pole is below the plate the upper ends of the filings diverge from the pole, and the agitation sends them outwards, unless the magnetic attraction be considerable.

CHEAP ELECTRICITY.—In a recent note sent to the Academy of Sciences by M. Genard, "On a Battery of Iron Turnings," he thus describes the apparatus: "I replace the zinc of a Bunsen's battery by iron borings; an iron bar placed in the middle of the borings serves as a rephore; the iron is placed in common water. In the porous vessel I place a solution of perchloride of iron with aqua regia added. The electricity of this solution is collected by a carbon serving as the positive pole. The carbon is made of powdered coke agglomerated with paraffine. Such a battery may be made of large dimensions, and a great deal of electricity obtained at a small cost.

Heat has always been supposed to assist the union of gases which possessed an affinity for each other; but a Frenchman has found that oxygen has no tendency to unite with hydrogen, carbonic oxide or carbon, at a temperature higher than the fusing point of platinum.

THE LARGEST LITHOGRAPH ever taken is one of the present French Emperor, which was recently executed on a stone four feet in width and eight feet in length.

San Francisco Savings Union.....	178,411 09	180,273 04	9,636 04	112,349 42	10,213 96
Total increase.....	\$1,967,102 62	\$1,992,807 22	\$93,121 88	\$25,915 68	\$189,830 48
Total decrease.....					\$189,830 48

*Interest in suspense not included.

†Guarantee Capital, or Capital Stock, included.

The decrease of cash on hand, although the deposits have increased to a very great extent, shows a much more prosperous condition than during the period of the last report, when large cash balances were carried forward under Legislative agitation for the repeal of the Specific Contract Act. The failure of this repeal scheme resulted in the restoration of full confidence in financial circles, opening the loan channels as freely as the specie paying deposit tide set inward. Out of the earnings for the past six months, the Hibernia Savings and Loan Society have declared a dividend of one per cent. per month, less the Federal tax; the Savings and Loan Society, ten per cent. per annum, free from Federal tax, for the same period; the French Savings and Loan Society, ten per cent. per annum, also free from Federal tax; and the San Francisco Savings Union, on ordinary deposits, ten per cent. per annum, and on term deposits, one per cent. per month—both free from Federal tax. The California Building, Loan and Savings Society reports annually in the month of October, and for this reason we at present lack statistics from that institution. The Hibernia Savings and Loan Society have 6,365 depositors; the Savings and Loan Society, 2,900; the French Savings and Loan Society, 2,000; and the San Francisco Savings Union, 1,758—total, 13,023. This would give an average amount of \$672.66 to each depositor on the total sum rendered—\$8,760,164.52—and as compared with the

population of San Francisco, taking it to be 120,000, give to each inhabitant a fraction over \$73.

The dullness incident to the Mining Share market for the past month still continues, but during this week nearly all stocks have been well sustained, and for the most part are firmly held at the close.

Hale & Norcross has met with trifling sales at \$1,600, and closes at \$1,750 asked. There is no new feature in the mine, every portion of which continues to look exceedingly well.

Savage rose from \$1,140 to \$1,175, receded to \$1,155, rallied to \$1,165, and sold yesterday at \$1,165, s. 30. During the week ending 18th inst., 1,031 tons of ore were extracted, and 756 tons shipped from the mine. The approximate value of the ore extracted amounted to \$48,000, and the estimated cost of the reduction and extraction of this ore was about \$22,000. The new body of ore, in the north drift, 6th station, is now 10 feet wide, and promises to become a valuable addition to the resources of this mine.

Crown Point receded to \$875, advanced to \$890, and closes at \$950. The product of this mine now averages about 100 tons per day. The Rhode Island mill commenced running again on the 21st instant.

Gould & Curry has not been dealt in this week, but is well maintained at \$790 asked. The small seam of ore discovered recently, 290 feet south of the Bonner shaft and fifty feet below the 2d station, may, it is thought, lead to a development of some importance at a greater depth than has hitherto been attained. The receipts of bullion will probably amount to \$120,000 for the current month.

Yellow Jacket is in better favor, and some 100 feet were sold, advancing from \$650 to \$720, b. 30, closing yesterday at \$735, s. 5. During the week ending 13th and 21st instant, 58 tons of 1st class, and 4,752 tons of 2d class ore were extracted from the mine, and the yield of bullion amounted to \$127,380. Considerable 1st class ore is now being found in the south mine, which is netting the company \$300 per ton. We are informed that this mine is looking better than at any former period.

Ophir has been in more request, rising from \$210 to \$235, and selling yesterday at \$225. Telegraphic advices state—"North Drift unchanged; Ore in a street tunnel running low; Vein in the 7th station not well defined." Receipts of bullion to the 21st instant exceeded \$22,000.

Chollar-Potosi rose from \$173 to \$180, then sold at \$179. Operations have been resumed below the Potosi tunnel. Throughout the Potosi station ore continues good, and some ore of good quality is also being met with in the old stopes of the Bajazette ground. The south drift from the main shaft is in 360 feet, and is supposed to be yet 80 feet distant from the vein. During the week ending the 18th instant, 492 tons of ores were sent to Custom mills.

Belcher was dealt in at enhanced rates; advancing from \$115 to \$155, closing at \$160. Empire Mill and Mining Company was sold at \$114@110 per share.

Imperial has fluctuated but little, selling at \$90@95, closing at \$100, b. 30. The new shaft is now down 520 feet. Both the Rock Point and Gold Hill mills are running up to their full capacity, and the ore from the Alta mine continues to show some improvement.

Confidence declined from \$53 to \$45, and closed at \$46, s. 10. Overman was dealt in to the extent of 1,000 shares within a range of \$23½@29½, b. 10, closing at \$24, b. 30. Bullion rose from \$24 to \$31, and sold yesterday at \$29.

Omnibus R. R. was dealt in at \$55 per share. North Beach and Mission is held at \$43 bid. This latter company has been paying regular dividends of ½ per cent. per month for some time past.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday, amounted to \$248,443.50.

FROM IDAHO.—We give the following extract from a letter dated Boise City, I. T., August 11, 1866. We hope to hear from our correspondent, according to promise. We have taken the liberty to make use of the following from his private note of the above date: "Early next month I propose to visit Rocky Bar and Yuba, to get a ton or two of choice rock to be sent to England, as a sample of Idaho ores. At Yuba a similarly rich streak to that which you have before noticed as having been found in the Leonard lode has been discovered in the Robert Burns' lode. I have not yet heard full particulars.

"Dufresne & Co's mill, for Yuba, passed here two days since; but it will be as much as they can do to get a fair start this fall, as there is no road yet opened suitable for their heavy machinery, and they will have to work at road-making as well as freighting. Owing to bad management, I fear Rocky Bar has been set back two or three years; but Mr. John Greene, superintendent of the Worthingham company, informs me that he purposes to start as soon as he can complete some needed alterations in the mill, and for that purpose is awaiting instructions from headquarters. Mr. Creighton has gone out easterly to make arrangements about telegraph poles, and intends as speedily as possible to have this place in telegraphic communication with the civilized world.

"Times here are dull; but farmers are busy harvesting, and all seem satisfied, as the crops are excellent."

Address to the Voters of San Francisco

We, the members of the Democratic County Convention, respectfully addressing ourselves to the Voters of San Francisco, claim for the ticket we have nominated your approval and support.

We have succeeded in securing gentlemen of irreproachable character and acknowledged fitness to serve as candidates. In making the selection, we have been careful that schemes for personal aggrandizement and mere political success should not shut out from view the future welfare of the community. The peace of the city, protection to property, and fidelity to the part of the custodians and dispensers of the public moneys, are the considerations which have controlled our deliberations.

We are persuaded that a change for the better can be made in the manner of administering the several Departments of the City Government; and this we believe to be the general conclusion in the public mind.

Whilst it is conceded that much credit was due, for a time, to those who managed our municipal affairs in an independent spirit, it is also contended that more recently they have ignored the former proper tests for official position, and have become mere partisans, intolerant in their views and prejudiced in their action. With this change in the spirit of their government, there has also come extravagance in public expenditures, oppression in their license system, and corruption in the police regulations. Reform is therefore needed in the City Government. This reform can be effected only through the agency of the ballot box. To that end we heartily invite the co-operation of the voters of San Francisco.

Nor should it be forgotten that the result of the approaching election will, to some extent, affect all the social and monetary interests of our city. Moreover, it will exert an important influence on politics throughout the State; and in order that the people may fully appreciate the political significance of the victory we fervently hope to achieve, we shall briefly declare the principles which our nominees adhere to, touching their duties and the great issues of the day.

We pledge them to a faithful discharge of the obligation their election will cast upon them.

We pledge them to an unwavering support of those principles of our Government which assert the supremacy and vindicate the dignity of the white race.

We pledge them to the doctrine of the equality of all of the States of the American Union, and the right of each in individual case to determine, under the Constitution of the United States, the qualification of its electors, and to provide for its local prosperity and domestic happiness in its own way; and

We pledge them to a firm adherence to the policy of the National Administration, looking to the defense of these great principles as the only means calculated to heal our differences, to secure for the Government the undivided affection of the people, and to the Union of the States that freedom, prestige and power rightfully belonging to a great Republic; and, in conclusion,

We declare that they approve of the call for a National Convention, and hope that beneficial results may come of its patriotic purpose.

Finally, we beg leave to say that the evasion practiced by the County Convention of the opposite party on these vital questions, is, in our opinion, designed to accomplish a great political fraud; and is trifling with the intelligence of the people and the interests of the State. We condemn as dangerous, ill timed, and characteristic of Radicalism, the letter and spirit of the address put forth by that body. It is but an appeal to the passions of party at a time when those powerful in war and successful in battle should be just and magnanimous in peace.

Mining Summary.

CALIFORNIA.

Alpine County—

From the Silver Mountain *Bulletin* of August 11th we gather the following items: The George Washington company are now taking out, for working at the Washington mill, some of the richest ores ever taken from this claim. They have now some fifty tons on hand, and by the time the mill is ready for crushing, they will have at least one hundred and fifty.... On Monday morning of this week work was commenced in good earnest upon the mill. Laborers are busily engaged in digging a foundation for the batteries, while the millwright is preparing the frame-work therefor.... The O. K. company have cut their ledge through the foot-wall, and are running along the casing, stripping the vein as they run north. They will probably cut across the ledge the latter part of this week, and commence taking out ores for crushing.... Lady Franklin company are taking the statutory steps to perfect the title to their claim, by compelling parties who have not signed the Trust Deed to come forward and do so, or abide the action of the law in such cases made and provided.... The tunnel of the Illinois California company is now in nearly 400 feet. They have made good progress from the commencement, notwithstanding the exceedingly hard rock which they have encountered. The Sacramento ledge is about three hundred feet ahead, and the tunnel will be continued until it is struck.

The same paper has an editorial on the "Mines of Alpine," from which we quote: The ledges that cross Alpine county are conceded to be on the Virginia City and Gold Hill range of argentiferous quartz, and embrace in width, from southeast to northwest, a distance of twenty miles in an air line. Assays from a few of the mines in this county have reached from \$4,000 to \$5,000 per ton, among which we name the Esmeralda No. 2, of Monitor district, and George Washington No. 1, of Silver Mountain. But the real test of the value of ores is the results obtained from workings. Antimony to a greater or less extent is found in all our ores, and in order to extract all the precious metals contained in them, a partial roasting becomes necessary. The highest yield obtained by the working process has been from the Morning Star, at Mogul, the yield from one working being at the rate of a ton over \$800 per ton. Next in order of yield comes the I. X. L., which, from a number of tons worked at the Pioneer mill at Markleeville, yielded over \$100 per ton. Buckeye No. 1, a parallel lode with the I. X. L., from fourteen tons realized to the stockholders a ton over fifty dollars per ton.

Butte County—

The American *Flag* of August 14th, reports the discovery of an immensely rich quartz ledge, forty miles in some direction or other from Oroville, traceable 3,000 feet, from four to six feet wide, fabulously rich, and inexhaustible. It is named the Jennie.

Calaveras County—

A correspondent of the *Chronicle* has the following: "Why can't we coax the great gold-bearing quartz range through Calaveras county? * * * Weekly we submit a brief description of a few 'bunches' situated within one mile of West Point: Chas. Goulson & Co., width of vein, two feet; depth, fifty feet; length of bunch, 100 feet. Two hundred feet south of this, discovered bunch No. 2, last Saturday; width of vein, two feet; depth, 100 feet; better quartz than bunch No. 1, worth \$120 per ton. Johnson and Willis: width of vein, one foot; depth, thirty feet; length of bunch, thirty feet; \$140 per ton. Hare & Valencia: width of vein, one foot; depth, thirty feet; length of bunch, forty feet; \$50 per ton. Leuhard & Co.: width of vein, two feet; depth, twenty-five feet; length of bunch, ninety feet (drifting); \$60 per ton. Chino & Cruz: width of vein, 1½ feet; depth, sixty feet; length of bunch, forty-five feet; \$80 per ton. Reed & Hillary: width of vein, two feet; \$70 per ton. Baggalupi & Co.: width of vein, twenty inches; depth, forty-five feet; \$60 per ton. Reed & Co.: width of vein, fifteen inches; depth, eighty feet; \$46 per ton. The above are only a part of our paying quartz claims; time prevents me from mentioning many others at present. Last Saturday Mr. F. Morris discovered a vein, in the bed of Bear Creek, which promises to be a 'peculiar spot.' It is three feet wide, and will average over \$100 per ton. The writer saw a piece of quartz, taken from the vein three feet deep, weighing 1½ pounds; offered twenty dollars for it, and was refused."

El Dorado County—

Among the ledges in the vicinity of Georgetown is what is known as the "Horn Blain." This lode is so extensive that it is traced to Forest Hill on the north and Placerville on the south. The west wall rock of this ledge is composed of granite from forty to fifty feet in thickness, then quartz from two to four feet

thick. This is succeeded by a sandstone formation some two feet thick, followed by quartz again a foot in thickness, then slate; then the Greenstone, or "Horn Blain," extending south through Amador county—being very wide. There is every indication that the rock in this ledge is very rich in gold-bearing sulphurets. I am fully convinced that the entire divide between the South and Middle Fork of the American river is one vast body of quartz, which in time will be prolific in wealth. I have just been shown a splendid prospect taken from one pound of quartz from a shaft thirty feet deep, on what is supposed to be an extension of the Collins' lead. This claim is owned by Dr. Stone and R. Murphy. Twenty-five cents was obtained from one pound of this rock.—*Exchange*.

Inyo County—

The *Tulare Times* of August 18th says: Lieut. Hephurn has just returned from Owen's River. He reports the mines in that locality as being very rich and successfully worked.

Kern County—

This new county already has a newspaper. The *Weekly Courier*, published at Havilah, says, August 18th: This county has a larger scope of country embracing gold-bearing quartz than any other county in the State. The population of Kern has been drawn from all parts of the State, and the opinion is universal that there are more than twice as many claims placed upon her records than upon those of any other. Experience has proven that, the greater the depth, the greater the dimensions of the vein and its richness. Many of the claims are held by men who wish to sell, consequently no work is being done upon them. But this evil will soon be corrected. Capital is gradually flowing in. The fact that men from San Francisco, Grass Valley, Nevada, etc., have invested to a large amount, is the best argument we can offer in favor of the mineral richness of this section of the State.

A letter to the *Mariposa Free Press*, dated Kelsey, August 7th, says: At the "Hope Vein" they had made another clean-up, and out of three tons of rock got about four pounds of gold, worth fourteen dollars per ounce. The proprietors have since struck rock paying richer than ever.... A Mr. Pettis has bought the Rogers mill at Kelsey, and is now doing custom work.... The Abbott & Monkton company are about commencing operations.

Klamath County—

The *News* of 11th instant says that George Somes and Andrew Merrill have discovered at the mouth of Salmon a quartz ledge which prospects \$200 to the ton. The ledge is said to be six feet in width. The prospect was obtained from a piece of average rock, which was pounded in a mortar; the pulverized rock was then washed in a common wash-pan.

Mariposa County—

We clip the following from the *Free Press* of the 18th inst.: Tuesday last, we visited the Feliciano mine and mill, situated about four or five miles from Colorado. This mine is owned by a Mexican company. The shaft is 190 feet deep. The proprietors pay eight dollars per ton for crushing. The mill is owned by Louis Trabucco, of Bear Valley, who also owns two shares in the mine. The mill contains five stamps, and crushes about eight tons per day.

Want of space compels us to defer, until next week, a condensed summary of the editorial in the *Free Press*, in reference to those Mariposa mines, which are outside the Fremont grant.

Nevada County—

The *Gazette* has these items: We learn that Josiah Rogers, owner of the vineyard, hydraulic diggings and quartz ledge on American Hill, has leased the ledge for one year to William R. Duff, agent of an Eastern company, and conditionally sold the ledge and other property. The company are to erect machinery and prospect the ledge, and have the privilege of purchasing it, together with the vineyard and gravel diggings, within the year, for fifty thousand dollars.... We learn that Captain Kidd has sold his interest in the Banner mine to Charles Marsh and D. Crittenden. The papers were put on record, and the property delivered, yesterday forenoon. The interest sold was five-twelfths, the amount paid being \$62,500—being equal to \$150,000 for the whole mine.... In the Fox copper mine, they are now down to a depth of nearly forty feet, the ledge being about eight feet in width at that depth, but somewhat broken, and the ore mixed with greenstone. For this reason they have saved but a comparatively small quantity of ore in the past month or six weeks. They have, however, about forty tons of ore on the ground, which it is believed will average over twenty per cent. copper.... The test by working process at the Star mill, of the rock taken from the "Jim" ledge, having been satisfactory, the purchase will be concluded. The amount to be paid for the ledge is \$15,000, and the purchase is to be concluded by the 25th of this month.... The owners of the Stockton mine, situated near the Globe ranch, in Grass Valley township, have leased the same to G.

D. Roberts, Perrin & Co. The lease extends to five years, and the owners are to receive one-eighth of the gross proceeds of the mine.

The following are from the *National*: The Washington has struck a one-foot ledge which promises well.... The negotiations for the purchase of the North Star mine have been brought to a close. The sum paid is \$400,000, and the purchasers are represented by W. H. V. Cronise. During the past four years a net profit has been realized from the working of the mine of near half a million dollars, of which \$375,000 has actually been divided among the owners, and \$125,000 expended in the erection of a mill and other improvements.... The Lone mine is being vigorously developed. They have now a well defined ledge in the south drift, running toward the Lone Jack; and in the north drift, while the ledge is looking better than ever it has, the shoots or stopes show immense quantities of free gold.

The *Union* gives a list of twenty-seven quartz mills in Grass Valley township, the total number of stamps being 285, to be increased to 300 in a few weeks, by the completion of the 15-stamp mill of the Lucky company.... The negotiations for the Norambagua are completed, and the purchasers took possession on the 15th inst. They are A. C. Peachy, W. H. V. Cronise, M. Attwood, Hon. Ogden Hoffman and W. E. Dean, of San Francisco, and W. H. Rodda, of the North Star mine. The sum paid, as we have before stated, was \$100,000.

The San Joaquin company, at Sweetland, after a run of twenty-one days cleaned up \$16,000. A one-twelfth interest in this mine has recently been sold by Richard Kent for \$5,000. *Nevada Transcript*.

EXCELSIOR.—The *Sun* has these items: Three tons of ore from the U. S. Grant mine gave a return of \$330—making \$110 a ton.... The quartz mill of Persons, Martin & Co. at Carlisle, was started up Monday week, on ore from the mine of the Mountain Chief company. It is the intention to crush ore from the Grant mine next.... A *Transcript* writer says of the mines about Old Man Mountain: That many of the ledges are rich I cannot question. And if rich, they have advantages in the way of size, location, etc., over any other quartz mines in the State or world. I must hazard the prediction that in a few years the mines in the Upper Quartz Belt of California, will be acknowledged as the best on the globe.

A letter from Meadow Lake yesterday says: "This is the dullest town I have seen. Our daily *Sun* only rises twice a week now, and we have suspended our city incorporation; all of which looks discouraging to outsiders. Business of all kinds, excepting mining, is dull, and I suppose there will be little improvement this year."—*Gazette*, Aug. 16.

Placer County—

The *Herald* of the 14th instant has these items: The shaft on the Mohawk is down thirty-five feet, and the work is being prosecuted night and day. The ledge is four feet wide on the surface, and prospects well in free gold. It was located by the Leet Bros., one month ago.... Quartz from the Pleiad, taken from the depth of eleven feet, looks well. The ledge is two feet in width.... Pugh's quartz mill, at Ophir, is now kept constantly at work on custom rock.... Several tons of quartz from the Rising Sun ledge, at Colfax, was recently crushed at Grass Valley, and yields \$27.27 per ton.

Plumas County—

The *Union* has these items: Larrison, Moore & Co.'s claim on Black Hawk, has averaged an ounce per day to the hand for the past two months.... The ore from the Prince ledge, near Taylorville, which was smelted in Chipman's Furnace in Genesee, yielded about 4,000 pounds for the amount of ore smelted, viz: 18 tons.... Mr. C. J. Rice sold his claims on Black Hawk one day this week to Horace Reynolds of Badger Hill. Price paid \$650.... Fred. King & Co.'s new quartz mill at Mohawk Valley commenced crushing quartz for the first time on Tuesday last. The company have a large quantity of rock on hand, ready to be worked.

Sacramento County—

The miners at Willow Spring Hill, and other points in this vicinity lately on a strike, on account of the price of water, are all at work again.—*Folsom Telegraph*, Aug. 18.

Shasta County—

From the *Courier* of August 18th, we clip these items:—The Potosi commenced crushing rock last Thursday.... The miners in Dog Creek are doing well, and money is plentiful.... The Mammoth mill will again commence operations on Monday next, crushing rock from the Harrison lode. A good supply of rock is now at the mill, competent men have been engaged, and everything betokens a favorable run.... George McKean has lately returned to prospect a lode discovered by him on Flat Creek eight years ago, but not worked, placer mining being then in fashion. It promises well. By reducing the rock in a common hand mortar he has realized from two to six

dollars per day. He is now engaged in erecting an arrastra.

Sierra County—

The following items are from the *Messenger* of the 18th: The Montpelier Company have purchased the stock of the Sailor Company, heretofore in other hands, and now own the whole mine.... They paid at the rate of \$20,000 for the claim.... The Red Rock lode in Slug Cañon is being re-opened by a shaft. The rock so far prospects well, and is similar in appearance to the Good Hope rock. We understand the company intend having a few tons tested at the Montpelier mill.... The boys on the Good Hope claim are pushing along their lower tunnel with a rapidity truly surprising. In nine days they have run and timbered nearly sixty feet. About seventy feet more it is expected will take them to their ledge. In the meantime they are taking out rock from the upper level for crushing at the Gold Bluff mill.... The result of the Sailor Company's last run exceeded their expectations. The tunnel, as it progresses into the hill, daily develops more rich rock.... Jack Alderson & Co.'s hydraulic diggings are cleaning up with every prospect of good pay. Gold is sprinkled plentifully along their ground-slucies, besides they picked up over \$2,000 in nuggets, before setting their boxes.... The Oro claim is to be re-opened.... The Montpelier mill cleaned up on Monday last, after a run of twelve tons of Good Hope rock, and found that it paid over \$25 to the ton.... We saw at the Bank of H. Scamman, a few days since, a specimen of gold-bearing quartz. The lump weighs 159 ounces, and good judges say there is not more than three pounds of quartz. The piece was found about two feet below the surface in French Ravine, just below the mouth of Wet Ravine.

Correspondent of same paper, at Forest City, says: The Live Yankee claims are doing very well, making satisfactory clean-ups each week. The same is true of the claims worked by Messrs. Ellery & Marriot. The mining districts of Nebraska appear to come up to the usual average of the last few years. *Siskiyou County*—

The *Yreka Union* of Aug. 18th says: Some very rich rock was struck in the Shasta Butte Ledge on Humburg, a few days ago, some of which prospects as much as \$500 to the ton. The shareholders are considerably excited and are making preparations to work it more extensively.

Letter to same from Scott River, August 12th, says: The wing dams will soon be in a condition to give a good account of themselves. The derrick claims are in full blast. Of these, the French Ivy claim is the best paying on the river, realizing as high as two ounces a day to six hands, (mostly Chinese.) The Morgan on French Bar, too, pays handsome dividends to its owners. In spots nature has been prodigal. A few days ago I was shown three winsome looking pieces of real stuff, weighing respectively 8½, 5 and 3 ounces. They were found in Whiting Hill; the finder is Capt. Jackson, the pioneer of Stone River.

Tuloume County—

The owners of the Mount Vernon claim, situated near Columbia, cleaned up last week, after a run of ten days, two hundred and twenty-six ounces of gold.—*Exchange*.

Yuba County—

The *Appeal* of the 21st has the following: The Pennsylvania Mining Company, Brown's Valley, has just crushed 110 tons of their quartz, yielding \$3,400, or \$31 to the ton. This result, besides placing the finances of the company in a most healthy condition, is, however, chiefly of great importance as it shows so rapid and marked improvement in regard to the richness of the rock. The ledge is twelve feet in width.

The Blue Gravel Company, at Smartsville, Yuba county, cleaned up last Tuesday, after thirty days' run, nearly \$30,000.

NEVADA.

Washoe—

The Gold Hill *News* of August 14th, says: Our metropolis is living up very rapidly, and that there is every reasonable indication that real "good times" for old Storey are not merely approaching, but at hand. Everyone is remarking the improvement in the value of property in Virginia. In one year our place will be as stirring as in '63, or nearly so.

We are in possession of an authentic statement in regard to the discovery of immensely rich placer diggings not far from this town, which leads us to expect that within a few months there will be a "mining excitement" in Nevada such as will rival the rushing days of California. We are not at liberty to indicate the precise locality of the New Dorado. Three men who have been working a claim in the diggings referred to, during the past six months cleared \$15,000. A two bushel barley sack of dirt from a claim adjacent to the one spoken of was brought to Virginia a day or two since. From it \$38 in gold was taken. Four men lately, on literally surface dirt, averaged \$18 per day. And they are confident that the av-

erage yield through a large district which they have described to us will be from \$12 to \$20 per day per man. From two to twenty feet below the surface there is free gold and silver in quartz—the latter, of course, requiring the services of the mills to work it. We assure our readers that we here only recount what has been told us by citizens of Virginia of unimpeachable character for truth and veracity.

A very rich streak of ore was recently encountered in the Gould & Curry mine. It was found in sinking an incline from the second to the third level of the mine in order to create a better circulation of air, and is about five hundred feet southwest from the Bonner shaft, and over four hundred feet below the level of D street.

The great shaft of the Empiro and Imperial companies is now nearly five hundred feet deep, and drilling will be commenced shortly. The shaft is being sunk jointly by the two companies near the divide, in the ravine where the trail passes, generally taken by foot passengers going up from Gold Hill. This shaft is calculated and intended for the working of both of these mines at a very great depth.

Reese River—

The *Reveille* has the following items: We learn from Mr. J. H. Murphy that two tons of ore from Dr. Keller's location on the High Bridge, in the Philadelphia district, yielded 2,020 ounces of crude bullion. It is estimated that after melting, the yield of bullion will be at the rate of nearly \$800 per ton. Of course the ore worked was assorted from the mass. . . . We learn that excellent ore is being taken from the Morgan & Manney mine. We believe the ore is extracted from the original levels. . . . The building for the mill of the New England and Nevada company was being pushed rapidly ahead. The walls of the building are up and ready to be roofed in. . . . R. M. Widney, notes of a recent prospecting trip, say of Hot Creek district, that about fifty men are at work. In Philadelphia district, large quantities of ore are being taken out. In Wisconsin district, the veins, which are gold bearing, range from two to twenty feet thick, and their mineral, which contains traces of silver, has yielded by assay from a few dollars to quite \$500 per ton in gold. Silver Peak district, he says, only needs to be touched by the enchanter's wand, which is the poetical term for skill, capital and labor. The Vanderbilt contains immense deposits of rich ore. Its vein has been exposed by stripping for the length of 1,600 feet, and drifts have been pushed into the hill from ten to thirty feet long, cutting the vein in every instance. The "pay streak" in the vein varies from twelve inches to three feet in width, and is continuous and unbroken. It has been demonstrated by the reduction of several hundred tons of the ore in Martin's mill, that it will yield from \$100 to \$400 per ton.

On the Indian Jim ledge, Hot Creek, a shaft ten feet in depth has been sunk, and large masses of rich ore containing much horn silver disclosed. The ledge has recently been sold to a party abundantly able to develop it. The price paid was fifty thousand dollars, and the locators retain an interest of one-fifth forever unassessable. . . . In Mountain View district, the Old Dominion ledge is the one most worked. A number of tons of ore are ready for the mill, every piece of which is coated with horn silver.

A new district, the Empire, has been discovered and organized, 120 miles southeast of Austin. Twenty ledges have been located, the principal of which are called the Chieftain, Five-Twenty, Ten-Forty, and Four Partners. Portions of the outcropping ore of the veins have been assayed with good results, varying from \$12 to \$127 of silver per ton. . . . Recent developments in Santa Fe district are of a highly satisfactory character. Specimens of ore from the King ledge, by assay, yielded as follows: First class, \$1,854.70 per ton; second class, \$203.25.

The Nye County *News* of August 11th, has these items: A. Silvester, from Philadelphia district, reports everything in a flourishing condition; the mines are opening out handsomely, the mill will shortly be ready for operations. . . . The shipment of bullion, by the Knickerbocker mill, amounts to 3,966.64 ounces. Mr. Varney, of Austin, who has been at the mill superintending the working of the ore for a few days, gives it as his opinion that the success of the Knickerbocker is now placed beyond a doubt.

Letter to same paper from San Antonio says: Several of our leading operators have had associates in the East procuring capital for the development of our mines. Their efforts have been crowned with success, and agents are now on their way here, and will arrive in time to commence operations in earnest some time in August. * * The Lee mine is being vigorously worked day and night. They are taking out very rich ore. . . . The Pioneer mill, which cost \$120,000 in gold, and when finished was worth less than \$50,000, and which weakened on crushing one hundred tons of ore, is now being rebuilt at an additional expense of

\$20,000. . . . The Liberty mill company will soon commence the erection of steam hoisting works on their mine. The Potomac Hill mines are now idle, and will be for thirty days yet, on account of neglect of trustees in business matters. The Potomac has several tons of \$300 ore piled up on the dump. The tunnel has been run nearly two hundred and fifty feet, which will cut the veins some two hundred feet below the surface.

Correspondent of same at Weston, Mammoth district, says: The late developments of the Rosecrans shaft are of a remarkable character for the depth attained. After sinking the main shaft ten or twelve feet below the water line, drifts were started both east and west, the one on the east designed to meet the tunnel started at the base of the hill (which is now in 240 feet). In this easterly drift, eighteen feet from the shaft, the workmen have struck a body of ore eight feet wide. Through the entire lode sulphuret of silver is thickly sprinkled, with occasional blotches of ruby and native silver. . . . Work has been resumed on the American Flag lode. The last ore raised showed native silver.

Esmeralda—

The Union of the 18th instant has these items: The Utah company it is said will soon resume operations, and the Antelope, probably. The Philadelphia, Golden Age and Empire and Crockett companies, are driving away as energetically as ever. The Oxford Beta and Union tunnels are going ahead as rapidly as they can be pushed. The whole camp is awakened from its lethargy, and the confidence of its inhabitants is revived. . . . The mining prospect of Bodie, we are informed, was never more flattering than at present. Twelve tons of ore from the Homestake claim, worked dry at the Empire mill last week, yielded \$160 per ton. The miners of the Empiro claim have opened the third level at a depth of 260 feet, and find the vein greatly improved. The vein is from four to five feet thick, and the pay is much better than in the level. The mine yields about forty tons of ore per day, all of an improved quality. . . . John D. Winters, of Gold Hill, has purchased the Junata mine, on Martinez Hill, and intends to put a large force of miners to work on it immediately. His mill is being repaired with all possible dispatch, and will be in readiness for crushing the ore by the time the miners get fairly to work. . . . The Locomotive company have leased their claim on Silver Hill to N. Trojanovich, who commenced taking out ore a few days since. . . . It is currently reported that a party owning leads in Columbus have purchased a large mill in California, and that it is now on the way hither.

Humboldt—

From the *Register* of August 11th we gather the following: Work goes on bravely on in the Seminole company's tunnel, with fair indications that the rock will continue to improve as the work advances. The tunnel is now in 160 feet, and will cut the cropping ledges at a depth ranging from 480 to 700 feet below the surface, fully proving the mine with this one tunnel. Much interest is felt in the success of this enterprise, as the mine is believed to be of great value. . . . There was quite an excitement in regard to the re-locating of claims on the night of the 30th instant. Men who had expressed their disgust of rich croppings, clay casings, and "f-et" in general, became suddenly anxious to take a few more chances. The merits of claims that had almost passed into oblivion were discussed with a confidence and buoyancy of spirit refreshing to a disappointed prospector.

Letter to same from Paradise Valley says: Little work going on in the Winnemucca mines just now—owners negotiating with capitalists. Ore difficult to work by pan process; should be smelted to work well. Holt's mill running on Monroe ore, which will average \$300 per ton.

Pahranaagat—

The Nye County *News* of 11th inst. says: We had the pleasure of a call, on Wednesday last, from Mr. George Ernst, of Pahranaagat, who, in company with six others, made the trip in five and a half days, coming by way of Indian Springs. Mr. Ernst gave a most glowing account of that section, and said that the permanency and value of the mines is already placed beyond doubt. Parties are making arrangements for the erection of smelting furnaces, and several mills are expected to be in that district before winter.

A letter to the Salt Lake *Vedette* says that Wm. Raymond has arrived with a quartz mill.

Black Rock—

The Humboldt *Register* of the 11th has this item: Hon. M. S. Thompson arrived in this place on Wednesday last, direct from Black Rock mines. He has examined the mines carefully, and believes them very rich and extensive. He brought in samples of ore rich in silver.

IDAHO.

The *Avalanche* of August 11th has the following items: A very rich ledge, named Sherman, has recently been discovered in Flint

District. It is located near the head of Astor Gulch, and the title to it is in dispute. Twenty-five pounds worked by mill process, by Col. Fogus, gave at the rate of over \$600 per ton. Four pounds worked by hand-mortar process yielded a brick of bullion 2½ ounces. The ore is almost black with sulphurets. Not enough has been done to determine the size of the vein, but it is probably six feet. . . . In Flint, the Black Bros. have commenced preparing a mill site to receive their 5-stamp mill, which they expect will certainly arrive in ten days. . . . Stamper is the title given to a recent quartz discovery on Florida Mountain. It lies about fifty feet east of the Varney & Carrio. The vein is three feet near the surface, with good solid casings and very rich quartz. Mr. Stamper & Co. discovered the ledge, and own to the north of the discovery, and the N. Y. & O. Co. own south. The latter company have commenced earnest work on it. On Wednesday they set eight men to sinking on it, and sent up a blacksmith shop and other necessary appendages of a mine. The ore prospects well. The Whisky Gulch mine is yielding some very rich ore, and the ledge is becoming larger and better defined. . . . The Great Republic ledge was discovered and located about three weeks ago. It is situated half a mile below Boonville, north side of Jordan Creek; is twenty-five feet wide, and bears north and south. Two assays have been made—one by McDonald & Co., giving \$20.99, and another by King, Webb & Co. of \$32.96 per ton. . . . D. H. Jackson, Esq., has rented the Shoeborn mill, and expects to have it crushing ore the coming week. . . . D. C. Patterson, who, with two others, started two months ago from Idaho City, to explore the country lying east of Fort Hall, at the base of the Wind River mountains, had returned. He has made up a company of forty or fifty men, and will again visit the same region. The small party had several narrow escapes from Indians. They think they have found another gold field.

A correspondent writing from Idaho City to the *Statesman*, says: The mines belonging to the Golden Reel mining company are on the divide between Elk and Grimes' creeks, and about seven miles distant from Idaho City. The mill is located on Deer Creek, a tributary to Elk. Ten stamps are constantly kept running on ore from the Buffalo ledge, which yields satisfactorily. One team with two yoke of oxen is constantly employed in hauling ore and wood for winter use. Deer Creek supplies an abundance of water during all seasons of the year. The ore from the various mines yield from thirty to forty-three dollars per ton. The machinery is got up in the most workmanlike manner, with an engine of 20-horse power. . . . In the Buffalo ledge there is a tunnel on the east side of the divide 125 feet deep to a shaft of eighty feet in depth, from thence a continuance. From the shaft of ninety feet on the west side of the divide, a tunnel of 125 feet is run on the ledge. Another tunnel is commenced, which will, when completed, tap the ledge at a depth of 240 feet below the surface. Ledge from three to four and a half feet wide. . . . The Stevens' ledge is over thirty inches wide, and has a shaft on it of over 135 feet, with two drifts of forty-six to sixty feet each. . . . The Golden Reef No. 1 is thirty inches wide; has a shaft on it of thirty feet, with bottom drift of the same distance. The next opening will be over sixty feet from the surface. The Golden Reef No. 2 is a ledge of sixty feet in width, of a talcish nature—the pay rock lying in deposits of a spider-web nature. The tunnel on this ledge is 170 feet in length, drifted at right angles sixty feet to a ledge, and continued along foot wall forty feet, and along the hanging wall thirty feet. The Golden Reef No. 3 is four feet wide; shaft thirty feet. . . . The Lucky Bill is a new ledge, and has a shaft of thirty feet on it. One ton of the rock has been crushed which yielded thirty-four dollars. The ore from the various ledges have yielded as follows: Buffalo, thirty dollars per ton; Stevens, thirty-five dollars; Golden Reef, forty-two dollars. Wood in abundance, of the best quality. Water the whole year round without expense. The expense of extracting, delivering and reducing the ore is only \$10 per ton, notwithstanding the high price of labor and subsistence. The distance from the mill to the several mines is three-quarters of a mile. . . . Other mills are in operation in this vicinity. The Illinois and Gambinus ledges are constantly worked with success. Others are being prepared to receive machinery which is on the road from the East. . . . The creek claims are in full blast, and will continue so until interfered with by Jack Frost.

MONTANA.

From the *Post*, of August 4th, we gather the following: On Alder gulch, the California company are working very successfully. Dunneau and McGovern are also doing well. McDermitt is sluicing some good looking dirt, and expects to make a big clean up this week. Levi Lusk has quite a number of hands employed, and seems confident of taking out a "pile" ere the season closes. The company at work on Rummer Dan's bar, below here, are

taking out big money, having their ground well opened and working it with hydraulics. . . . Capt. Ralph Bledsoe, recently from Idaho Territory, left here on Wednesday morning, with a party of two hundred miners, for the purpose of prospecting the Wind River mountains. It is generally believed that these mountains abound in minerals, but they have hitherto been unprospected on account of Indians. . . . Twenty-eight newly discovered quartz lodes were recorded in five days. . . . Rents are rising in Virginia City. . . . S. D. Bennett's quartz mill, for Summit district, has nearly reached its destination. . . . We learn from Mr. Patton who has just returned from Ramshorn, that Thomas Dryansore, owner of the Monitor lode, is running a 12-stamp mill, and made a run of \$250 a cord. . . . A nugget of pure gold, weighing nineteen ounces, was taken out last week, in the dry gulch lately opened near the head of Bivins. . . . On Thursday last, we were shown a fine prospect taken from Granite gulch, situated six miles northwest of this place, of forty-five cents, from two pans of dirt which were obtained, one from the bed rock, and the other five feet above. Five hydraulics will be in operation in eight or ten days.

In Summit district, the Seneca Falls mill has been sold to a New Yorker, who will soon put it in operation. . . . The Scranton have erected a fine stone mill at the foot of Kearsargo hill. This mill is supplied with a Douglas Crusher and a Dodge Re-grinder, and shaking tables. They are now taking quartz from the Bryson lode. . . . The Excelsior mining company, in French gulch, are now setting up a 20-stamp mill, with all the needful amalgamators. B. F. Christenot, has machinery for two mills on the way here—on a crusher, the other stamps. . . . We learn that the St. Louis company has made heavy purchases in Summit, with a view to putting one or more mills thereon. Conner and O'Neil have a stamp mill *in transitu*, which will arrive probably in September. . . . In Hot Spring district, the stamp mill and amalgamators of the Hosmer company, of New York, will be erected upon the lodes discovered by Hall and Spaulding. . . . Mr. Atkins, agent of the Gold Ore company, of New York, is now on a visit to this district, with a view to select and develop property, preparatory to the arrival of machinery, early next spring.

Letter to same paper from Blackfoot, says: The mines still hold good around Carpenter's bar, and Hog'em flourishes. Understand very good placers have been discovered at and in the vicinity of Nevada creek, between this place and Jefferson.

A twenty-three mile ditch, of the capacity of 3,000 inches, to bring water from the Passamari river (stinking water) to Alder creek, is now being surveyed.

The Columbia *Citizen* of August 18th, quotes from a private Montana letter: "I arrived in Helena on the first of June, in company with several others. I started on the third, on a prospecting tour, and we are on it yet. We have tried what is called the best mines, but have been unable to find anything to pay us, and I am of the opinion that we shall have to give it up. There are at least ten thousand men prospecting in these mountains, with about the same success.

I promised to write to you what I thought of this country, and I must say that I have been disappointed. 'Tis true that there are some good claims here, but, in my opinion, all the mines in this Territory are not worth so much as old Tuolumne in her palmy days. * * If you or any of my friends have any idea of coming this way, take my advice and stay at home. Or, if you are not content in Tuolumne, and must have a change, go any where but to Montana. Some of our party are working out by the day, having become disgusted with prospecting; and, you may be sure we shall all leave as soon as practicable.

There may be more mines discovered here, but from all I can learn by diligent search and careful observation, I am of the opinion that this is a poor country for mining."

The *Republican* says that L. G. Turnley, the present owner of the Park mill, has put it in complete repair, and has been running a week on fourth class rock from the Sultana. He cleaned up over one thousand dollars.

OREGON.

The largest lump of ore we have ever heard of being found in the Northern mines, says the Dalles *Mountaineer*, was taken out a few days since on Olive creek. It weighed eighty-two pounds, and had fifty pounds of pure gold.

ARIZONA.

The *Alta* of 19th inst., says: A mercantile firm in this city has received from La Paz a letter of the date of August 8th, thirty-six days later than any which have come by mail. * * Wm. Thompson, Superintendent of the Great Central mine, has commenced to smelt copper at Williams' Fork. By information from an eye witness, his furnaces are a success. The copper obtained is said to be 90 per cent. We have seen a small sample of it, which looks

(Continued on Page 123.)

Mining and Scientific Press.

W. B. EWER, SENIOR EDITOR.

O. W. H. SMITH. W. B. EWER. A. T. DEWEY.
DEWEY & CO., Publishers.

Office—No. 505 Clay street, corner of Sansome, 2d floor.

Terms of Subscription:

One copy, per annum, in advance, \$5 00
One copy, six months, in advance, \$3 00
For sale by Carriers and Newsdealers.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the Mining and Scientific Press, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Canvassing Agents.

Our FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. Thomas Starr is Agent for the Mining and Scientific Press in Nevada, and will canvass the principal cities, towns and districts of that State. August 25, 1886.

Mr. O. P. Truesdell will act as our Corresponding Agent and Solicitor in the interior of this State, from this date. August 25, 1886.

Mr. E. F. Dewey is duly authorized to receive subscriptions and advertising, and transact business for this office. August 18, 1886.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. San Francisco, Jan 11th, 1886.

Mr. L. N. Hudson, is authorized to solicit subscriptions, advertising, etc., for the Mining and Scientific Press, in San Francisco, and to receipt for the same.

San Francisco:

Saturday Morning, Aug. 25, 1886.

AN ETHNO-HISTORICAL SOCIETY, has just been organized and incorporated in this city. John W. Dwinelle has been elected President; J. W. Winans, Treasurer; Louis R. Lull, Secretary; and H. H. Haight and John T. Doyle added to the offices, constitute the first Board of Trustees. The workings of the Society are divided into three sections, namely: Ethnology, History and Geography. The formation of such a society must be taken as an increased interest in the cause of general science among our citizens. Situated in and building up as we are, a new commercial center, midway between the new world and the old, the fields of science and research about us are new, rich and extensive, and when properly worked cannot fail to yield a most abundant harvest.

The ethnologist will find on the Pacific Coast and neighboring islands, almost illimitable ground for research and study; while unearthed from beneath the immense drift deposits of California, he will have placed before him the remains of races and families of men which must be referred to a period, the date of which, when considered by the geological changes that must have been wrought since they lived; would seem to place the earliest European human remains in comparatively modern times. The field of historical research is already badly in need of earnest and efficient laborers; and we doubt not the record of the society will soon show important progress in that direction. The geographical section is wide, important and inviting; and we presume that ere another summer passes away, among other facts of interest, the observations and discoveries of the Russo-American Telegraph Expedition will be fully collated, under the auspices of the society, and the work of this section be inaugurated with proceedings and revelations of unusual interest.

SUSPENSION.—In answer to several inquiries with regard to the monthly "Miner," published by the Mining Bureau Association of this city, we can only say that no number has been issued since the first of July. Whether the suspension is permanent or merely temporary, we are not informed. A call for a meeting of the members of the association for July 9th, to consider the feasibility of continuing the same, failed to bring together a quorum. What steps, if any, have since been taken in that direction we have been unable to learn.

MECHANICS' INSTITUTE.—At a meeting on Monday evening last, the directors were authorized to mortgage the property of the Institute, and borrow the necessary money to complete the new building—not to exceed the sum of \$40,000.

IMPROVEMENT IN STEAM-BOILERS; SUPERHEATED STEAM.

The boiler of a steam engine usually costs more than the engine itself, and considering the wide use and indispensable service of this great reservoir of motive power, there is no instrument more imperfect, or for the improvement of which there is so great a field for the employment of inventive genius. A steam boiler of ideal perfection should secure complete combustion, so as to obtain all the heat which the fuel will yield, and should be able to convey that heat to the water, so as to form all the steam due to its application, and should, furthermore hold the heat, so developed, in the steam with perfect security until it has been applied to the engine.

How far short of this perfection the best constructed boilers of the present day come, is most painfully apparent to every engineer and mechanic. There is much reason, however, for believing that the invention of Mr. Danford, of Geneva, Illinois, to which allusion has been several times made in these columns, is a long step in the right direction, and an important one. This invention is nothing more nor less than the application of superheated, instead of saturated steam to motive purposes. The tremendous effects of a small quantity of water suddenly converted into superheated steam has long been known and remarked upon; but until Mr. Danford's invention, no device has ever been suggested by which this tremendous power could be controlled and utilized. The Lenoir gas engine ought to have led to such a discovery, but it does not seem to have done so. Danford's invention consists in suspending a hollow cast iron globe, of small diameter, in the midst of a furnace, and injecting into it just water enough to make the requisite quantity of steam to drive the piston one stroke. The quantity required for that purpose is very small, and necessarily so; for no boiler, of the ordinary mode of construction, could be made strong enough to hold a large quantity of such steam as is employed for this generator. The attempt to do such a thing would be preposterous.

It is said that several of these engines have been put up in the Eastern States, and have been found to work well, at least for a time. One has also been constructed at the Union Foundry in this city, for an agent of the Danford company, and experiments have been made with it at the wood yard on the Long Bridge, but, for some reason, it has not yet been found to succeed so well as to admit of its running for any considerable length of time. The persons having it in charge, however, are confident that the difficulties, which are merely mechanical in character, will soon be obviated. The experiments thus far seem to have proved that there is very great economy in this mode of applying steam, although we are not inclined to admit, as fully authentic, the reports of the Chicago trial.

The difficulty, in this city, appears to be to regulate the jet of water to the amount of steam required for instant duty. Another obstacle encountered is the imperfect lubrication of movable steam joints when the steam is working at a temperature of from four to five hundred degrees, and with a corresponding pressure. The interest excited by this invention, and the importance of making it a success, will not, however, allow any mere mechanical hindrance to intervene, to obviate which is within the reach of possibility.

Already we have no less than four inventors in the field, each claiming for his invention priority in time or superiority of design. Mr. Danford's name was first publicly connected with the invention; but we have also a Californian, Mr. B. F. Harris, of this city, who claims both precedence and superiority of design over Danford. Mr. Harris filed a caveat for the principle of employing steam, to be immediately used as fast as generated, in driving the piston of an engine, anterior to any appearance of Danford at the Patent Office. His caveat, however, was incorrectly filed, as an improvement to the steam engine instead of the steam boiler; by reason of which he was

not notified of Danford's application until after a patent was issued to him. His priority of right is now before the Commissioner of Patents for investigation, through the agency connected with this office.

A Mr. Attwood and a Mr. Conant have each, also, either made application or obtained patents, which are said to conflict more or less with Mr. Danford. It is reported, however, that a union of interest has been affected between Danford and Attwood. We are not aware of the peculiarity of Mr. Attwood's invention. The inventions of Mr. Harris and Mr. Conant appear to be quite similar in character, both differing from Mr. Danford in the important particular, that while the former use heated coils or tubes, and a double generator, where the steam is first obtained as "wet steam," and subsequently changed to superheated; the latter, by the use of a simple "rose jet," converts his water instantly into superheated steam. Messrs. Harris and Conant claim a large economy of fuel and a great excess of power over Mr. Danford, as well as a greater durability of tubes and receiver.

The question of the possibility of the employment of superheated steam for motive purposes, appear thus to be in a fair way of being fully decided, and at an early day. If it can be made to work, and be properly regulated, it will completely revolutionize steam power, and reduce its cost almost to the minimum of the power theoretically due to the amount of fuel employed.

CALIFORNIA MINING INVENTIONS IN AUSTRALIA.—The Australians are giving full credit to the superiority of California processes for saving gold, over anything yet attained in that country, or elsewhere out of California. The Wheeler pans, especially, are creating much interest among mining men there, as we learn from Dicker's *Mining Record*. That paper states that Mr. Farmer, formerly of this city, after some preliminary experiments for establishing the value of this invention for gold saving, has organized a company at Sydney, which is about erecting machinery to work over the refuse tailings from the different quartz mills on Bendigo. They have already purchased, conditionally, tailings in different parts of that region, to the extent of 400,000 tons, and purpose erecting machinery in other districts as soon as that already in process of erection has been placed fully under way. Arrangements have recently been made, says the *Record*, with the Messrs. Langlands, of the city of Melbourne, for the ground whereon to erect an engine and set of pans, so as to give the public an opportunity, at that point, also, to witness the operation of the machinery, and judge of the value of this new process for saving gold. Tailings will of course be brought to that city from the mines. It was the intention of the parties at first to sell the pans to the different quartz mills; but the company has finally concluded to change its original purpose, and go into the present extensive operations on their own account. The pan has been patented in all the mining districts in Australia.

The *Record* is of the opinion that the quartz of Australia is not so fully charged with sulphurets as that of California and Colorado, and for that reason fears that the working of the pans, when they come to be put to continued service, may not realize the anticipations which have been formed from experimental trials. We presume that by this time the Australians have become fully satisfied that the pan is nearly if not quite as essential in working quartz with free gold only, as for working that which is highly charged with sulphurets. Such is the experience of miners in this State. No quartz mill in California is now considered anything like complete without pans of some kind.

TO CORRESPONDENTS.—We acknowledge the reception of a very interesting letter from Mr. L. Prevost, with regard to his projected enterprise of silk manufacture in this State, which will appear next week; also, a communication upon the patera process in lower California, and another letter from our Sierra correspondent "Vijador."

DR. AYER'S PROCESS.—The *Amador Ledger* of the 18th inst., says that the process devised by Dr. J. C. Ayer of Lowell, Mass., for desulphurizing ores, and obtaining the precious metals therefrom, has been tried at two different mills in that county. It will be recollected that a large company was formed in New York some eighteen months ago, which bought this process, and issued proposals for selling the right to use the same; giving as endorsers of its value and practicability, the names of Professors Silliman and Torrey, and Dr. Hayes of Boston. In our issue of July 22d, 1865, we ventured to call in question the value of the process, and expressed surprise that such men as the gentlemen named, could be induced to lend their names in aid of such a project. In a later issue, (October 21st, 1865), we published a letter from Dr. Ayer, in which he complained of the eaveriness of our criticism upon his discovery. In reply, without expressing any dissent from our previous opinion, we admitted a willingness to await practical results therefrom. We now have them very briefly, but somewhat tersely stated, in the following paragraph from the *Amador Ledger*, of the 18th inst.:

The very astounding process [Ayer's] is a "hilk" of the first water—having been tested to the tune of many thousand dollars at two different mills in this county.

If quartz operators and others engaged in expensive and intricate metallurgical operations, would take the most ordinary steps to inform themselves with regard to the various "processes" in which they propose to engage, they would often save themselves many thousand dollars. We have repeatedly warned the public to beware of worthless inventions and processes, and have often pointed them out, and shown how and where such information as they needed might be obtained, at very little or quite free of cost. Some we know have profited by such advice; others, thinking that five dollars a year was too much to pay for such information, have gone in blindly, and lost their thousands. The number of such foolish victims, we regret to say, is constantly increasing.

THE HAMILTON GOLD AND SILVER MINING COMPANY.—We have received the prospectus of the above named company, whose principal office is located at 224 South Fourth Street, Philadelphia. The mines of this company are twenty in number, and are located in the Mammoth and North Union mining districts, Nye county, Nevada. We made an extended notice of these mines when first discovered, based upon a large quantity of very rich and rare specimens therefrom, which were brought to this city. The capital stock has been fixed at \$1,000,000, divided into 200,000 shares of five dollars each. We notice among the officers and directors some of the leading men of Pennsylvania. The prospectus before us sets forth a brief description, in general, of the district where the property is located, as well as a more particular description of ten of the principal mines, written by A. Blatchly, mining engineer of Austin, Nevada, and several others by J. P. Hutchinson, also a mining engineer of the same place. The managing director of the company is Hon. Robert W. Hamilton, of Nevada.

DR. D. J. MCGOWAN is engaged in making a hasty examination of the mineral, agricultural and physical resources of this and our neighboring State of Nevada, previous to his departure for China, where he hopes to be of some service to the residents of the Pacific Coast, in extending our commercial intercourse with the nations of Eastern Asia. We notice among the published proceedings of the Board of Aldermen, for Monday last, that the Special Committee, to whom was referred the address of the Doctor, delivered before the Board on the 6th inst., made a written report, thanking him for the same, recognizing the importance of the work in which he is engaged, and suggesting the importance that means should be taken by the State Agricultural Society, and by the Chamber of Commerce of this city, to aid him in his undertakings.

Norbert Landry's Coin Album.

(Patented as a Coin Holder.)

This Album can be made of any desired size, to Preserve and Display a Hundred or Thousands of Coins.

Full information may be had concerning this interesting invention, by addressing the inventor and patentee, Mr. NORBERT LANDRY, San Francisco. An editorial description of the Machine will be found in the MINING AND SCIENTIFIC PRESS of August 11th, 1886. A CALIFORNIA "NOTION,"—At the meeting of the Boston Nautic Society, last week, a member presented to the Society, in behalf of the inventor, Norbert Landry, of San Francisco, a coin album—an ingenious invention, designed for the keeping and exhibition of coins. The pieces are placed between two sheets of glass, set in wooden frames, which revolve on an axle within a box, and occupying but half a circle, so that the box can be shut. On opening the box, successive layers of coin appear. The members of the Society examined the Album with much satisfaction, and passed a vote of thanks to Landry.—Boston Correspondence of the Sacramento Union. 7v13-1t

A Rare Chance!

A Splendid Business in Alameda County.

FOR SALE AT A GREAT BARGAIN,

400 ACRES OF LAND,

INCLUDING

Landing, Wharf, Three Capacious Warehouses,

Capable of holding 12,000 Tons, which amount of grain was stored and shipped the past year. Connected with said business there is an extensive Lumber Yard; sales during last year, two million feet, which sales, and the entire business, can be largely increased.

The above is a rare opportunity for parties desirous of engaging in an active business that will pay a large dividend on the investment. Satisfactory reasons given for selling, and all information desired can be obtained on application by mail, or otherwise, to

G. F. SMITH,

Notary Public and Searcher of Records, office "Beatty House," San Leandro. 8v12 1m

CAUTION!—TO WHOM IT MAY CONCERN.—The public are hereby notified that a patent was allowed Dec. 27th, 1884, and issued June 27th, 1885, to Professor HENRY WURTZ for the use of Sodium and Amalgam thereof with quicksilver, in the extraction of precious metals from their ores. All persons using said Amalgams, or purchasing or selling Sodium or said Amalgams, for use in the treatment of gold or silver ores, are hereby cautioned that they will be prosecuted to the full extent of the law.

SODIUM OR MAGNETIC AMALGAM.

THE WURTZ AMALGAMATION COMPANY,

OF NEW YORK,

Assignees of letters patent granted to Prof. HENRY WURTZ, the discoverer of the use of Sodium in the amalgamation of gold and silver ores, having established an agency in San Francisco, now offer to the mining community their amalgams, with full directions for their use, on the MOST LIBERAL TERMS. A large supply of the Amalgam, of any required strength, can be had on hand.

The terms and conditions upon which rights to use the process are obtainable, can be had on application to WM. SLOSSON, Agent of the Company, Union Iron Works, corner of First and Mission street, San Francisco. 8v13

REGULAR MEETING, Monday, Aug. 20, 1866.

Dr. Kellogg in the Chair.

Ten members present.

Minutes of previous meeting read and approved.

Messrs. W. H. Knight and A. Godeffroy were elected resident members.

Mr. John Swett was nominated for resident membership.

Donations to Library: Bibliography of North American Cenozoology; Cretaceous Reptiles of the United States, by Leidey; Paleontology of the Upper Missouri—Invertebrate, part I; List of the Coleoptera of N. A., part I, by Dr. Leconte; New Species of N. A., Coleoptera, part I, by Dr. Leconte; Researches upon the Hydrobiidae and allied forms, by W. Stimpson, M. D.; Monograph of American Corbiculidae, recent and fossil, by Temple Prime; Land and Fresh Water Shells of N. A., parts II and III, by W. G. Binney; Check List of the Invertebrate Fossils of N. A., eocene and oligocene, by T. A. Conrad; Check List of the Invertebrate Fossils of N. A., cretaceous and jurassic, by P. D. Meek; Catalogue of Minerals, with their formulas, etc., by P. Eggleston; Instructions for research relative to the Ethnology and Philology of America, by George C. Gibbs.

All of the above presented to the Academy by the Smithsonian Institute.

Journal of the Royal Horticultural Society of London, vol. I, part II: new series; Map and Text of Geological Survey of Sweden.

Prof. Blake read a paper upon a "New Locality of Fossils in the Gold-Bearing Rocks of California," and exhibited specimens of Ammonites from a cut on the line of the Central Pacific Railroad, near Colfax. Although the specimen exhibited was quite perfect, it was not sufficiently so to enable the septal to be seen. Prof. Blake remarked that these fossils were undoubtedly of the secondary period, and that they were apparently specifically identical with those from the American river, in the same vicinity, of which he had sent photographs to Mr. Meek, in 1863, and afterward noticed the same at a meeting of the Academy in September, 1864; he also thought them identical with the species found at Bear Valley, Mariposa county. Prof. Blake also exhibited the tooth of an extinct elephant, a *molar*, found in the auriferous gravel near Michigan Bluffs; also, shark's teeth and other marine remains from Tulare Valley; these remains were found by him at an elevation of at least twelve hundred feet above the sea, and probably belong to the post-pliocene period. Prof. Blake alluded to a "Quarry of Gold-bearing Rock" in Placer county, known as the Banker or Whisky Hill mine, where no regular quartz vein exists, and the rock of the hill is profitably worked; some forty tons per diem are crushed, yielding from two to twenty dollars per ton—averaging from five to six dollars per ton.

Mr. Stearns remarked the discovery of additional species of marine shells at Baulines Bay by Dr. Kellogg and W. Harford; also, several species of *Helix* at Belvidere ranch, near Capt. Morgan's house on the south side of Baulines Bay.

Prof. Blake mentioned that the tooth of a mastodon had been found near Mount Diablo, by Capt. Stevcs.

Mr. Stearns read a paper upon the anatomy, geographical distribution, etc., of the snail, and the uses made of the same as medicine and for food, both in ancient and modern times.

Prof. Blake stated that he had in his possession a portion of a human skull, said to have been taken from a depth of two hundred feet below the surface, near Tuolumae county.

Adjourned.

T. H. BLOOMER, Secretary.

In our columns to-day will be found an advertisement of W. H. ALLEN, who has opened an office as Law Adviser and for general Collections, etc. We take pleasure in calling attention to his card, knowing his ability and promptness in his line of business must commend him strongly to all who call on him.

New Mining Laws of California and Nevada.

We have just issued, in cheap edition, the new laws relating to mining and corporations in California and Nevada, passed in 1865-6. Some of these laws are of the highest importance to parties interested in the matter of locating and holding claims, and prospecting mines, in these States. Copies sent by mail. Price, 25 cents.

Address, DEWEY & CO., Patent Agents,
San Francisco, May 1st, 1866.

Illegal Supplemental Advertising.—It would be well for Mining Companies, whose advertisements are repeatedly appearing in the Supplements of daily papers, to inquire into the legality of that class of advertising.

THE MINING PRESS comes loaded with a rich variety of mining intelligence, and all sorts of scientific interesting matter.—[Amador Ledger.]

THERE are many varieties of swallows, as our readers must know. None are more interesting than the common, lively little eaves-swallow, which builds its nest in villages under the eaves of our barns. A good many interesting stories are told of them.

One writer describes to us how a sparrow took possession of a nest which a young couple of swallows had just finished, and obstinately refused to get out. The injured couple soon succeeded in letting all their neighbors know about it, and they were all observed to fly away. In the course of half an hour they returned, each with its little dab of mud, and literally plastered the sparrow in his stolen house, where he no doubt died of hunger. The writer has seen the swallows collect and tear to pieces a nest which had been appropriated by a sparrow, and in which it had raised its young.

SOAP STONE CROCKERY.—Abel Stearns, Esq., who has been a resident of California for nearly forty years, informs us when he arrived here the pots commonly used in cooking were cut out of soap stone, found on one of the Santa Barbara Islands—Santa Catalina, we think he said. These pots or crocks were an inch thick at the side and two inches at the bottom, and had a vast amount of service in them. When once heated through, a long time elapsed before they would cool off.

LEARNING is like a river, whose head being far in the land, is at first rising little, and easily viewed; but still, as you go, it gapeth with a wider bank, not without pleasure and delightful winding; while it is on both sides set with trees and the beauties of various flowers; but still, the farther you follow it, the deeper and broader it is; till at last it enwavers itself in the unfathomable ocean. There you see more water, but no shore—no end to the liquid, fluid vastness.

It is the vice of the unlearned to suppose that the knowledge of books is of no account, and the vice of scholars to think there is no other knowledge worth having.

J. B. COX, BUSINESS AGENCY.—Makes private sales of Property and Business Places of every description, in the city and throughout the State; procures partners with large and small amounts of money; negotiates sales of mining property, and does a General Agency Business. Patronage solicited by mail, express, or by personal application at the office, 402 Montgomery Street, San Francisco, California. 23v11f

Machinists and Foundries.

PALMER, KNOX & CO.,

STEAM ENGINES AND QUARTZ MILLS
DUNBAR'S IMPROVED
Self-Adjusting Piston Packing,
Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.
WHEELER & RANDALL'S
NEW GRINDER AND AMALGAMATOR
HEPBURN & PETERSON'S
AMALGAMATOR AND SEPARATOR,
Tyler's Improved Water Wheel,
Giving the greatest power, at lower cost, than any wheel in use. There are over 1,500 running, giving universal satisfaction.
KNOX'S AMALGAMATORS,
WITH PALMER'S PATENT STEAM CHEST,
Superior for working either Gold or Silver Ores.
Genuine White Iron Stamp Shoes and Dies
Having been engaged for the past eight years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-1f

M. GREENBERG. W. H. MOORE.
GREENBERG & MOORE,
Eagle Brass Foundry,
No. 43 First Street, San Francisco,
(Between Mission and Market.)

MANUFACTURERS OF
all kinds of Brass and
Bell Castings; Force
and Lift Pumps; Cocks
and Valves of every de-
scription made and re-
paired; Oil Globes, Steam
Whistles, Hydraulic Pipe
and Nozzles (for Mining
purposes). Also,
COUPLINGS OF ALL
SIZES.

Particular attention paid to Hydraulic Pipes and Nozzles; also, to Ship Work of all descriptions. All orders from the interior will be attended to with promptness and dispatch. 23v12 3m

LEWIS COFFEY. J. S. WILSON.
LEWIS COFFEY & RISDON,
Steam Boiler & Sheet Iron Works.

THE only exclusively Boiler Making establishment on the Pacific Coast owned and conducted by Practical Boiler Makers. All orders for New Work and the repairing of Old Work, executed as ordered, and warranted as to quality. Old Stand, corner of Bush and Market streets, opposite Oriental Hotel, San Francisco. 21v12 1y

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mill Saw and Flour Mills, Water Wheels of all kinds, Hydraulic Hay, Rice, Screw and Drop Presses, Coining Machinery, File Drivers, Bark and Malt Mills, and all kinds of Castings.
ENGINES.—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.
BOILERS. Locomotive, Fire, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.
PUMPS.—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's Improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Veach's tubs, Frater's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.
OIL BORING TOOLS AND MACHINERY.—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.
Russia Iron Screens, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.
H. J. BOOTH.

Vulcan Iron Works Company

[ESTABLISHED 1850.]
First, Natoma and Fremont Streets.

IRON FOUNDERS, Steam Engine and Locomotive BUILDERS.

Boiler Makers, and Workers in Sheet Iron, Brass and Copper.

These Works have lately been increased by the addition of a new shop on Fremont Street, doubling the capacity of the original establishment. For and turning out machinery promptly and efficiently, are now unequalled in the State. Their Boiler Works have also been enlarged correspondingly.

The Company are prepared to execute orders for all classes of Machinery and Boiler Work, such as

Mining, Steamship, and Steamboat Machinery,
Railroad Machinery, Flouring Mills,
Locomotives, Quartz Mills,
Car Trucks, Sugar Mills,
Car Wheels, Saw Mills,
Housings and Irons; and
Manufacturing Machinery of Every Kind.

Sole Manufacturers of

HEPBURN & PETERSON'S REDUCING PAN AND AMALGAMATOR
BEATH'S AMALGAMATOR;
HESSE & MOORE'S IMPROVED HOWELL QUARTZ CRUSHER;
BAUX & GUIDO'S AMALGAMATOR AND SEPARATOR;
FITCHER'S QUARTZ CRINDER AND WATER WHEEL;
JOYNER'S IMPROVED WATER WHEEL;
LEFFEL'S AMERICAN DOUBLE TURBINE WATER WHEELS.
STEVEN'S PISTON PACKING RINGS.

They have also a large assortment of Patterns for Pumping and Hoisting Machinery, Gearing, Pulleys, Water Mill Irons, Hydraulic and Screw Presses, Retorts, Furnaces, Grate Bars, House Fronts, Ornamental Fence Posts and Paling, Stove Ranges, etc., etc.

Quartz Stampers, Shoes and Dies, of the best Hard Iron. Quartz Screens of Russia Iron Punched to Order. 27

of Mr. LOCHHEAD, who has been in the business in San Francisco for the last fourteen years, and enjoys the reputation of having built ONE HUNDRED AND SEVENTEEN STEAM ENGINES.

Screw Propellers of all kinds, and Steam Boat Machinery generally, made to order, and warranted to give perfect satisfaction in every particular. 23v12 3m

Mining Summary—Continued from page 119.

very well. The first charge yielded about 200 pounds of that description of copper by the estimate of our informant.

COLORADO.

From the Denver News of August 8th, we clip the following: Charley Utter arrived from the Bear Valley mines last evening, bringing specimens of the gold. From his statements, and our latest advices, we are led to conclude that the mines of Bear river are not a paying institution. Five men with a sluice succeeded in taking out fifty cents in one week. Another sluicing party of about the same number were not quite so lucky, getting only forty-three cents in return for a week's labor. Many of the miners are on their way back thoroughly disgusted with the country.

The gold is fine quality, and has a beautiful color. Not over fifty dollars has been taken out of the mines by the whole force there at work, numbering not less than seven hundred men. The lodes, if any exist, from whence the gold comes, have not been discovered. There are some few persons who yet have hope in the mines, but the great majority are leaving.

The Journal of the 4th, has these items: Mr. Morse, for the Gold Rock company, is sinking on the Mammoth lode, at the rate of ten feet a week. At 100 feet from the surface he has a crevice between walls seven feet wide with five feet of pay dirt, worth ten to twenty-five cents a pan. He raises by windlass, has an engine on the ground which will soon be put up. Captain Cox, for the Benton company, is setting up a large engine and putting in a six-inch pump. His shaft at the mouth of adit, right in Packard gulch, is sixty feet deep, has fourteen inches solid ore, which yielded \$108 a ton in gold per Lyon's smelting furnace. The cross courses let in so much water that it has been impossible to mine to advantage, so a pump is being put in. An average of four assays of Fiske ore showed at the rate of nineteen ounces of gold and thirty-three of silver per ton, \$316.15, coin value. The Sterling company are preparing to work their Fiske property. We learn that the Eagle company are going to resume mining on the Gold Dirt. Also that the Pleasant Valley company, whose works were almost destroyed by the shower of last Thursday, are going to immediately repair damages. They were making handsome monthly dividends prior to the catastrophe.

UTAH.

The Colorado Journal of the 3d says: This morning 5,200 pounds of castings went from Langford & Co.'s Foundry to Salt Lake. They are for Gen. Conner's reduction works, about forty miles west of the Mormon city, and consist of American Hearths for smelting galeous ores, with some necessary accompanying fixtures.

THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequalled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call special attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Brynn Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully solicited.

READ IT! READ IT!!

SACRAMENTO, April 16, 1866.
H. BOWMAN—DEAR SIR: THIS IS THE FIRST WRIT- ing I have done in two years, and it affords me great pleasure to be able to use my pen in the service of those who are suffering, as I have suffered, by stating the following facts:
I have for two years and upwards been afflicted with CHRONIC RHEUMATISM, and until a few weeks ago I have never found anything that afforded me any relief. For three months of the time I was unable to feed myself, and for the last five months my arms have been so bent that I have not been able to dress myself. I was five months at the Warm Springs, at San Luis Obispo, and three months at a Hydropathic Institute in Stockton, and I have been under the care of six different physicians, in the vain hope of relief. About four weeks ago I was induced by a person who had been cured by it to try a bottle of RICHARD'S REMEDY FOR RHEUMATISM, and in less than twelve hours I experienced great relief. In a few days I was enabled to straighten out my arms, and I have been getting better and gaining in strength and flesh ever since. I have now the complete use of all my limbs, and, for the first time in two years, I am out of pain. I do feel for those who suffer as I have suffered, and if they will take my advice, they will lose no time in giving the REMEDY a trial. Yours truly,
GEORGE TAYLOR.

RICHARD'S REMEDY is for sale by
H. BOWMAN,
Druggist, Sacramento. 3v12
Price, \$2.50 per Bottle.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the inqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced regulators. The Mining and Scientific Press Patent Agency has strictly complied with the requisitions of the Department, and properly filed all necessary papers as claim Agents.

EUROPEAN

METALLURGICAL WORKS,

Practical Mining School,
Bryant Street, between Third and Fourth,
SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuric, pyrites, and the (so-called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in the building all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as well as a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

S. P. KIMBALL, J. R. MURPHY.

IMPORTERS,

AND DEALERS IN
ASSAYERS' MATERIALS,
Druggists' & Chemists' Glassware,
Photographic Stock, Etc.
512 and 514 Washington Street,
SAN FRANCISCO.

WE are receiving direct from MESSRS. LADD & OERTLING (London) and BEEKER & SONS (Antwerp, Belgium) their superior

ASSAY AND BULLION BALANCES,

And from France and Germany, as well as the Eastern States, FURNACES, CRUCIBLES, MUFFLES, BLOW-PIPE CASES, GOLD SCALES, CHEMICAL GLASSWARE, and every article required for ASSAY OFFICES, LABORATORIES, etc. We have given this branch of our business particular attention, to select such articles as are necessary in the development of the mineral wealth of this coast. A Full Assortment of DRUGGISTS' GLASSWARE and DRUGGISTS' SUPPLIES, ACIDS and CHEMICALS, constantly on hand. San Francisco March 6, 1865. 1v10-1f

NAPA CITY, May 9th.—Messrs. DEWEY & Co., Patent Agents, San Francisco: Yours of May 7th is at hand. I am pleased to hear of the receipt of our patent papers at the U. S. Patent Office, Washington, D. C. You have my fullest thanks for your energetic movements concerning the same. Respectfully, yours, W. W. LEVERING.

Capitalists, Attention!

QUARTZ MILL & MINING PROPERTY
FOR SALE

In Nevada County.

A NEW 8-STAMP QUARTZ MILL, 7 LEDGES AND 640 acres heavily timbered Land, near Eureka, Nevada County, are now offered for sale. The Mill is run by steam-power, and is in complete order for business. The ledges, which form the principal value of this property, are all large and well-defined, but require a further outlay of capital, in order to make them remunerative. For the lack of means to properly develop these claims, the present owners are disposed to sell the same for a reasonable price.

Capitalists wishing to engage in mining will find this a splendid opportunity to purchase a property that will bear rigid scrutiny, and offers superior inducements as an investment.

For address and further information, inquire of the Publishers of the MINING AND SCIENTIFIC PRESS, 605 Clay street, San Francisco. 2v12

HAYWARD, COLEMAN & CO.,

IMPORTERS AND REFINERS

Illuminating, Lubricating,
PAINT OILS!

CONSISTING OF

KEROSENE, LARD, SPERM, ELEPHANT, POLAR, TANNERS', NEATFOOT, BOILED AND RAW LINSEED, CASTOR AND CHINA NUT.

SPIRITS OF TURPENTINE & ALCOHOL

NOTE.—We would specially call the attention of MILL owners and Engineers to our superior PARAFFINE OIL, which we manufacture from the California Petroleum. This oil will not smoke. Absolutely thoroughly cleaned and lubricated with it will not heat, and after remaining at rest, can be started without cleaning off.

A sample can of our Paraffine Oil will be forwarded on application to us, as we desire a fair and impartial trial.

Lamps and Lamp Stock!

An elegant and complete assortment on hand. 5v 4v13-3m 414 Front street, San Francisco.

THE CALIFORNIA

Aerated or Unfermented
BREAD COMPANY.

Bakery on Folsom Street,
Between Tenth and Eleventh.....SAN FRANCISCO

MESSRS. TAGGART, BULKLEY & DUFF, HAVING ASSOCIATED themselves in partnership, are happy in announcing to the public that they are now prepared, and would respectfully solicit all orders for their truly wholesale and cleanly Bread. We have a sufficient number of delivery wagons at our bakery to guarantee to all who may favor us with their patronage a prompt delivery of fresh bread daily. Sundays excepted.

Through the kindness of the gentlemen of the following named firms, we are privileged to keep an order box for the entry of all orders for the bakery so that they may reach our earliest attention.
Order box at C. J. Hawley & Co.'s Grocery, corner Second and Jessie streets; Rowland & Walker, 441 Clay street; Plumb's Carpet Store, Montgomery street, opposite Lick House; G. W. Clark, Paper Hanging, corner Sansome and Clay streets. Orders handed to any of the route-men like wise. We expect soon to be prepared to supply Pastry, like as the Boston Brown Bread, and Beans of the first quality. Due notice will be given.
The present Company is entirely independent of the former California Unfermented Bread Company, neither of them having been in any way connected with that company. We would cordially invite the public to make a visit to our new bakery. 4v13-3m S. R. BULKLEY, Business Partner.

And in accordance with law, and an order of the Board of Trustees, made on the eleventh day of July, 1866, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the auction rooms of John Middleton & Son, 404 Montgomery street, San Francisco, California, on the fifth day of September, 1866, at the hour of 12 o'clock, M. of said day, to the highest bidder, for cash, in United States gold coin, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

JOHN M. BURNETT, Secretary.

Office, No. 10 Exchange Building, (713 Montgomery street) San Francisco, California. au4

Gold Hill Tunneling Gold and Silver Mining
Company, Location: Gold Hill Mining District, County
of Storey, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 31st day of July, 1866, an assessment (No. 8) of one dollar per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, R. W. KENNER, 415 Montgomery street, San Francisco, Cal., or to the Superintendent, Mr. H. H. HERRICK, Gold Hill, Nevada.

Any stock upon which said assessment shall remain unpaid on the fourth day of August, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the twenty-ninth day of September, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

R. W. KENNER, Secretary.

Office, 415 Montgomery street, San Francisco, Cal.

A discount of three (3) per cent. will be allowed on all payments made on the above assessment on or before Friday, the 10th day of August, 1866. By order of the Board of Trustees.

R. W. KENNER, Secretary.

San Francisco, August 1, 1866. au4

Great Central Mining Company, Location:
Works: Yuma County, Arizona Territory.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the second day of July, 1866, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Kellogg, James	175	50	\$90.00
Livingston, H. B.	124	20	20.00
Symons, John	274	40	40.00
Wheaton, Wm. R.	274	20	20.00
Wheaton, Wm. R.	274	20	20.00
Wheaton, Wm. R.	274	20	20.00

And in accordance with law, and an order of the Board of Trustees, made on the second day of July, 1866, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Olney & Co., at No. 418 Montgomery street, San Francisco, Cal., on the twenty-seventh day of August, 1866, at the hour of 4 o'clock, P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

O. D. SQUIRE, Secretary.

Office, No. 302 Montgomery street, San Francisco. au4

George Washington Gold and Silver Mining
Company, Silver Mountain District, Alpine County, Cal.—
Assessment No. 13.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourteenth day of August, 1866, an assessment of one (\$1) dollar per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at the office of the Company, only.

Any stock upon which said assessment shall remain unpaid on the fourteenth day of September, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the first day of October, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

W. D. ROOT, Secretary.

Office, 338 Montgomery street, San Francisco. au4

George Washington Gold and Silver Mining
Company, Silver Mountain District, Alpine County, Cal.

Notice is hereby given, that the regular Annual Meeting of the above Company, will be held on MONDAY, September 17th, 1866, at the office of said Company, for the purpose of electing a Board of Trustees, to serve for the ensuing year; also, for the transacting of any and all other business that may properly come before said meeting.

W. D. ROOT, Secretary.

Hansen Copper Mining Company, Location:
Del Norte County, Low Divide District, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirtieth day of July, 1866, an assessment of fifteen cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at 609 Market street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the thirtieth day of August, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the eighteenth day of September, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

S. S. SWEET, Secretary.

Office, 609 Market street, San Francisco. au4

I. X. L. Gold and Silver Mining Company.

Notice.—The Annual Meeting of the stockholders of the I. X. L. Gold and Silver Mining Company, will be held at the office of the Company, No. 335 Montgomery street, on THURSDAY, September 13th, at 10 o'clock, A. M.

JAMES G. DAYLEY, Secretary.

Kentucky Copper Mining Company, Mue
Felix District, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the second day of August, 1866, an assessment of one dollar per share was levied upon the capital stock of said Company, payable on the third day of August, 1866, in United States gold and silver coin, to the Secretary, at his office, 641 Washington street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the fifth day of September, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the twenty-sixth day of September, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. A. BAUER, Secretary.

Office, 644 Washington street, San Francisco, Cal. au4

Lady Bell Copper Mining Company, Low Di-
vide District, Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the third day of August, 1866, an assessment of ten cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at 311 Market street, San Francisco, or to O. D. SQUIRE, Crescent City.

Any stock upon which said assessment shall remain unpaid on the third day of September, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-fourth day of September, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

C. HEYWOOD, Secretary.

Office, 311 Market street, San Francisco, Cal. au4

Nuestra Señora de Guadalupe Silver Mining
Company, Tayoltita District, Durango, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 25th day of June, 1866, an assessment, No. 24, of one dollar (\$1) per share was levied upon the assessable capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, E. P. FRIEDER, at the office, No. 210 Post street, or to the Treasurer, A. HANDELMAK, at his office, No. 337 Washington street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the first day of July, 1866, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the 18th day of August, 1866, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

E. J. PFEIFFER, Secretary.

Office, 210 Post street, San Francisco, Cal. j63j

Old Colony Silver Mining Company, Location:
Works: Austin, Reese River, Nevada.

JOHN F. LONIS, Secretary.

Office, 315 California street, San Francisco. au4

Simpson Mining and Milling Company, Mokelumne
District, Alpine County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the third day of August, A. D. 1866, an assessment of thirty cents per share was levied upon the capital stock of said Company, payable by the fourth day of September next, in gold coin of the United States, to the Secretary, at his office, south-east corner of Front and Jackson streets, up stairs, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the fourth day of September next, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on the twenty-fourth day of September next, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. B. BIGELOW, Secretary.

Office, south-west corner of Front and Jackson streets, up stairs, San Francisco, State of California. au4

Santa Cruz Petroleum Oil Works Company.—
Location: Santa Cruz County, State of California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the second day of July, 1866, the several amounts set opposite the names of the respective shareholders as follows:

THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Framework; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; a, Dies; c, Shoes; and o, Openings.

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan when properly constructed, are respectively 177, 118 and 132.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan one hundred and eighteen tons, and the Conical Pan one hundred and thirty-two tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes direct from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merit.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with the quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the
PACIFIC FOUNDRY,
1st
San Francisco.

LEFFEL'S American Double Turbine

THIS WHEEL, WHICH HAS HAD THE most unprecedented sale of any water-wheel ever made, and which has given unusual satisfaction whenever used, is now for sale by KNAPP & GRANT, 310 Washington street, San Francisco, where persons desiring to use water-power can be supplied. These Wheels are adapted to use from 10 to 5,000 inches of water, and from 4 feet to 500 feet fall. Let us know how much water you have either in miller's inches or cubic feet per minute, what fall you require, and what power you require. Write or send for circular to KNAPP & GRANT, San Francisco.

Leffel's Lever Jacks,

For railroads, cars, or wagons; Railroad Jacks for engines and cars; Track Jacks for leveling, with which three men, with a pair of these Jacks, can level more track in a day than twelve men working in the ordinary manner; also, Track Jacks, for relieving the axle of pressure to replace the brass. These Jacks are now in general use in the Eastern States, and give entire satisfaction. Also, Wagon and Track Jacks of the most superior make and kind. For sale by
KNAPP & GRANT,
1212-3m
San Francisco.

BAUX & GUIOD'S Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1884, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine Scientific Knowledge with Practical Experience, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary crushing apparatus in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The tripling cost for attendance; Its small cost; Its portability. The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the tripling power required to work them; They can be attached to any ordinary crushing apparatus.

We have the pleasure of referring parties interested to the following parties, who have our Pan in use: Jefferson Mining Company, Bowman's Ranch, Nevada county; The French Mill, Nevada City; Crall's Gravel Cement Works, Nevada county; Waltham's Chlorination Works, Nevada, Cal.; Gold Hill Quartz Mill, Washoe.

Manufactured at the Vulcan Iron Works and San Francisco Foundry, San Francisco, and at Hough & Thom's Foundry, Nevada City.

For further particulars, or to see this Pan in operation, call on or address
J. B. BAUX,
Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 418-6d

It tells us truly the Minute, Hour, Day of the Week and Day of the Month.

HORTON'S PATENT CALENDAR CLOCK!

MANUFACTURED BY THE

ITHACA CALENDAR CLOCK COMPANY,

Ithaca, N. Y., and for sale by

W. J. EGBERT, Agent,

At Job M. SEAMAN & Co's, 631 WASHINGTON STREET, San Francisco.

THIS TIME PIECE costs but a trifle more than any other good clock, and is just the article for every well-regulated business house, office, school, or in fact any place where a handsome, perfect time-keeper is duly appreciated. The Clock has two dials, the first being the same as an ordinary clock; the second has but one pointer, and shows the day of the week, the month and day of the month. It is arranged to mark the days in leap years with equal regularity. It is an eight-day piece, and runs from year to year without change. It can be examined at the Office of the MINING AND SCIENTIFIC PRESS. 21316d

To Ditchmen, Millmen and Others Requiring IRON PIPE.

M. R. ROSE, CORNER OF 9TH AND K STREETS, Alameda City, has facilities unsurpassed on this coast for the manufacture of IRON PIPE of every description. He also has on hand a deep well FORCE PUMP, of his own invention and manufacture, well adapted for oil wells. His tools being portable, pipe can be manufactured on the ground. 1912

EXCELSIOR PUMP!

HOOKE'S PATENT!

CHALLENGES COMPETITION!

THIS DOUBLE-ACTING SUCTION AND FORCE PUMP challenges competition, for simplicity, durability and power, and will work at any depth. The pistons for mining pumps are packed with hemp. The valves are reached by simply removing the "bonnets," thereby avoiding the trouble of raising a long column of pipe. They will raise as much water as TWICE their size of single-acting Mining Pumps, and are sold at half the price. We have never heard of the valves in this Pump being out of order. For their many superior points they are fast replacing all other Force Pumps. Reference can be given where this Pump is working with eighteen others of different patterns, and is pronounced THE BEST; also, from some of the best miners in the State who have them in use. For manufacturers, farmers or domestic use, we warrant them the best and cheapest. All sizes adapted to any power or any purpose. For sale by agents throughout the State.

J. W. BRITTON & CO.,

General Agents, 120 Front street, San Francisco. 212-3m

Send for Price List.

STODDARD'S CELEBRATED WATER FILTERS!

RENDER RAIN, RIVER, OR SPRING VALLEY WATER perfectly pure and healthy. Three sizes. Price, \$12, \$15 and \$18. For sale by

S. B. STODDARD, Corner of Battery and Pacific streets, 2112-3m June 23, 1885.

Union Amalgamator.

This Valuable Invention

IS FAST FINDING ITS WAY INTO GENERAL USE, NOT by means of combination of capital and influence, but on the strength of its own merits, and upon the principle that what is known to be good will be appreciated. Practical men acknowledge the UNION PAN to be scientific, the best, the cheapest, and most profitable. It now stands first on the list of all pans in use for the purpose of

Working Gold and Silver Ores.

It has been found that a low class of ores, also tailings from Mills, Sulphurets, etc., that will not pay to work with the common pans, may be worked with this and obtain large profits. The UNION PAN is manufactured in two sizes, and capable of operating upon large quantities of ore in the most efficient manner.

Parties interested in Quartz Mining, Mills, etc., will find it to their advantage to call and examine for themselves, and see its operation.

Gold and silver ores tested by regular mill process, at moderate cost, by

STRONG & CO.,

Economy in Advertising.—THE MINING AND SCIENTIFIC PRESS is the best and most economical mining advertising medium in this city. Our terms are less than one-half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

THE BELL BIRD.

One of the most singular of the feathered inhabitants of tropical forests is what is known as the "bell bird." Of all the babel sounds which reach the ear from the gorgeous growth of trees and shrubbery, of climbing vines and brilliant flowers—the curious cries, the jubilant songs, the angry chatterings, the growls, snarls, croaks and hisses from bird, beast, insect and reptile, nothing produces such a peculiar feeling upon the traveler from Christian lands, as the croakings from the burning heat beneath the shade of the gorgeous tangle of tropical vegetation, as the sudden sound which emanates at intervals from this singular bird, which a writer describes as follows:

"As the scorching heat of the midday sun approaches, and by one the busy sounds of insect and animal life die away, the flowers close their petals, the leaves droop languidly from every branch and spray, not a breath of air stirs even the delicate tree ferns; the stillness is that of death, as if the world of living things had ceased to be. Then as you crouch under the wide leaves of the plantain, seeking shelter from the burning heat, suddenly a loud sound is heard, like a deep, full-toned bell; a short time elapses, and again it sounds, and so on at intervals of three or four minutes; often other singers, of the same class, join in the peal, and then the "forest chimers" toll their mournful music from far and near. You cautiously creep out, and peer curiously in the direction of the noise, to discover what living creature could produce a sound so exactly like a bell. At last you spy him out, and catch him in the very act, seated on the top of a dead palm—his belly. By travellers he has been aptly named the "bell bird."

On the top of the head there is something like the horn of the fabled unicorn. This tube of flesh is hollow, and communicates with the palate. When the "bell bird" is silent, this strange spire-like affair hangs down over the beak, just as the red fleshy wattle dangles on the front of a turkey-cock's head; but, when sounding his bell-like voice, it is filled tightly with air, and stands erect and stiff as a horn. A late traveller says, "At a distance of three miles you may hear this snow-white bird, tolling every four or five minutes like a distant convent bell."

A Suspicious Snake Story.

Every one has heard stories about snakes charming and fascinating birds. This mysterious power has been particularly attributed to the rattlesnake, though the common black snake is also said to exercise it. In the case of the rattlesnake there are also stories of this power having been exercised over human beings, though we have never seen any well-authenticated instance of it, unless we credit the following rather incredible story about two boys in New Jersey:

The narrative states that the boys were in the woods looking for the cows, when they encountered a large black snake. One of them, described as an "inquisitive imp," resolved to ascertain by experiment whether there was any truth in the stories about snake charming. So he gave his companion a stick, and told him to keep his eye on the snake while he made the trial of its powers. He then advanced close to the snake and began looking steadily at him.

When the snake observed him in that situation he raised his head with a quick motion, and the lad said at that instant there appeared something to flash in his eyes, which he could compare to nothing more similar than the rays of light thrown from a glass or mirror, when turned in the sunshine. He said it dazzled his eyes; and at the same time the colors appeared very beautiful, and were in large rings, circles, or rolls, and it seemed to be dark to him everywhere else, and his head began to be dizzy, much like being over swift-running water. He then says he thought he would go from the snake, and as it was dark everywhere but in the circles, he was fearful of treading anywhere else; and as they still grew less in circumference, he could not see where to step; but as the dizziness in his head still increased, he tried to call his comrade for help, but could not speak; it then appeared to him as though he was in a vortex or whirlpool, and that every turn brought him nearer the centre.

The boy with the stick now began to think it time to interfere, and accordingly attacked the reptile and killed it. His comrade, however, was terribly affected, and remained for several days in a "melancholy and stupid situation."

We may very naturally consider this a "rather incredible story." Perhaps the most incredible feature about it is the boy's very remarkable description of the process of charming. The boy who could describe his sensations in the language which we have quoted, must have been a little philosopher.

Eyes! Eyes!! Eyes!!!

DR. HENLY, Oculist and Aurist, has received from Scotland one of the most miraculous remedies for the benefit of the human eye ever before discovered. It is unparalleled in its effects upon the diseases incident to this organ. It gives wonderful power to the optic nerve, and removes all the granulations from the lids, and all mucus film from the sclerotic coat without the use of instruments. In fact, it works like a charm on the eye, without giving any pain. You feel the effect of the medicine in different parts of the head. It drives the disease back into the system, which is better able to stand it than this tender organ.

Why will you suffer when you can be cured in a few days. persons who have been blind for ten years have been restored to their sight in a short time by the use of this medicine. I will treat any person's eyes in the State, and I do not give them relief in a short time, I will not charge them anything. Office, No. 751 CLAY STREET, opposite the Plaza, San Francisco. 22-112

WASHING POWDER.

THIS POWDER IS SUPERIOR TO ALL OTHER PREPARATIONS for washing and cleansing. It is made of pure material, and contains nothing that will injure the finest fabric. Equally as good for washing in hard as soft water. One pound will make three gallons of beautiful soft soap. Put up in wrappers of 1 lb each, and in wooden boxes of 10 lbs bulk. Ask your grocer for a package, and test its virtue. Manufactured at 207 Commercial street, San Francisco. 1513m

ANNUAL REPORT
—OF THE—
Pacific Insurance Company.

IN COMPLIANCE WITH THE ACT OF THE LEGISLATURE of the State of California, entitled "An Act concerning Corporations," passed April 22, 1880, the Pacific Insurance Company of San Francisco makes the following Annual Report:

I.—The amount of the Capital Stock of this Company is SEVEN HUNDRED AND FIFTY THOUSAND DOLLARS, and paid in GOLD. \$750,000
II.—The amount of the Assets is ONE MILLION AND FIFTY-ONE THOUSAND, FOUR HUNDRED AND EIGHTY DOLLARS AND THIRTY-SEVEN CENTS. \$1,051,426.37
III.—The Company has NO DEBTS.
IV.—The amount of insurance effected during the year, and which remained in force December 31, 1880:
Fire.....\$12,973,949
Marine.....481,408
This Company commenced underwriting Marine Risks, August 1, 1880.

V.—This Company insures against the following risks, viz.: BUILDINGS, HOUSEHOLD FURNITURE, MERCHANDISE, SHIPS, CARGOES, and other PERSONAL PROPERTY, AGAINST LOSS OR DAMAGE BY FIRE. Also, on CARGOES, TREASURES, COMMISSIONS, PROFITS, and WARE HOUSES, and on ALL MARINE AND LAND NAVIGATION RISKS, TO AND FROM ALL PORTS IN THE WORLD.

VI.—This Company will take on any FIRST-CLASS RISK not to exceed \$5,000 the limit fixed by law, and on large risks will reinsure to an extent consistent with PRUDENCE in other RESPONSIBLE COMPANIES.
J. HUNT, President.
A. J. RALSTON, Secretary.
